

Evading IDS, Firewalls, and Honeypots

Module 12

Evading IDS, Firewalls, and Honeypots

Evading IDS and firewalls involves modifying attacks to escape detection by an organization's security systems, whereas honeypots are traps set to detect, deflect, or counteract unauthorized intrusion attempts.

Lab Scenario

ICON KEY
 Valuable information

 Test your knowledge

 Web exercise

 Workbook review

The adoption of Internet use throughout the business world has boosted network usage in general. Organizations are using various network security measures such as firewalls, intrusion detection systems (IDS), intrusion prevention systems (IPS), and “honeypots” to protect their networks, which are the preferred targets of hackers for compromising organizations’ security. Attackers continue to find new ways to breach network security and attack these targets.

As an expert ethical hacker or pen tester, you must possess sound knowledge of the functions, role, placement, and design implementation of IDS, IPS, firewalls, and honeypots used in the organization, as well as understand the process that the attacker has used to evade the organization’s security in order to detect their intrusion attempts.

The labs in this module give hands-on experience in auditing a network against IDS and firewall evasion attacks.

 Tools demonstrated in this lab are available in
E:CEH-Tools\CEHv11
Module 12
Evading IDS,
Firewalls, and
Honeypots

Lab Objectives

The objective of the lab is to evade the IDS and Firewall, and other tasks that include, but are not limited to:

- Detect intrusion attempts
- Detect malicious network traffic
- Detect intruders and their attack weapon
- Evade firewalls using various evasion techniques

Lab Environment

To carry out this lab, you need:

- Windows Server 2019 virtual machine
- Windows Server 2016 virtual machine
- Windows 10 virtual machine
- Ubuntu virtual machine
- Parrot Security virtual machine
- Web browsers with an Internet connection
- Administrator privileges to run the tools

Lab Duration

Time: 85 Minutes

Overview of Evading IDS, Firewalls, and Honeypots

IDSs, which provide an extra layer of security to the organization's infrastructure, are attractive targets for attackers. Attackers implement various IDS evasion techniques to bypass this security mechanism and compromise the infrastructure. Many IDS evasion techniques circumvent detection through multiple methods and can adapt to the best possible method for each system.

The firewall operates on a predefined set of rules. Using extensive knowledge and skill, an attacker can bypass the firewall by employing various bypassing techniques. Using these techniques, the attacker tricks the firewall to not filter the generated malicious traffic.

Lab Tasks

Ethical hackers or pen testers use numerous tools and techniques to evade the IDS and firewall on the target network. Recommended labs that will assist you in learning various evasion techniques include:

Lab No.	Lab Exercise Name	Core*	Self-study**	iLabs ***
1	Perform Intrusion Detection using Various Tools	√	√	√
	1.1 Detect Intrusions using Snort	√		√
	1.2 Detect Malicious Network Traffic using ZoneAlarm FREE FIREWALL 2019		√	√
	1.3 Detect Malicious Network Traffic using HoneyBOT	√		√
2	Evade Firewalls using Various Evasion Techniques	√	√	√
	2.1 Bypass Windows Firewall using Nmap Evasion Techniques	√		√
	2.2 Bypass Firewall Rules using HTTP/FTP Tunneling		√	√

Remark

EC-Council has prepared a considered amount of lab exercises for student to practice during the 5-day class and at their free time to enhance their knowledge and skill.

***Core** - Lab exercise(s) marked under Core are recommended by EC-Council to be practised during the 5-day class.

****Self-study** - Lab exercise(s) marked under self-study is for students to practise at their free time. Steps to access the additional lab exercises can be found in the first page of CEHv11 volume 1 book.

*****iLabs** - Lab exercise(s) marked under iLabs are available in our iLabs solution. iLabs is a cloud-based virtual lab environment preconfigured with vulnerabilities, exploits, tools and scripts, and can be accessed

from anywhere with an Internet connection. If you are interested to learn more about our iLabs solution, please contact your training center or visit <https://ilabs.eccouncil.org>.

Lab Analysis

Analyze and document the results related to the lab exercise. Give your opinion on your target's security posture.

**PLEASE TALK TO YOUR INSTRUCTOR IF YOU HAVE QUESTIONS
RELATED TO THIS LAB.**

Lab**1**

Perform Intrusion Detection using Various Tools

An Intrusion Detection System (IDS) is a security software or hardware device used to monitor, detect, and protect networks or systems from malicious activities; it alerts security personnel immediately upon detecting intrusions.

 Workbook Review

Lab Scenario

The goal of the Intrusion Detection Analyst is to find possible attacks against a network. Recent years have witnessed a significant increase in Distributed Denial-of-Service (DDoS) attacks on the Internet, making network security a great concern. Analysts search for possible attacks by examining IDS logs and packet captures and corroborating them with firewall logs, known vulnerabilities, and general trending data from the Internet. IDS attacks are becoming more sophisticated; automatically reasoning the attack scenarios in real-time, and categorizing them has become a critical challenge. These processes result in huge amounts of data, which analysts must examine to detect a pattern. However, the overwhelming flow of events generated by IDS sensors make it difficult for security administrators to uncover hidden attack plans.

To become an expert penetration tester and security administrator, you must possess sound knowledge of network IPSs, IDSs, malicious network activity, and log information.

 **Tools demonstrated in this lab are available in E:\CEH-Tools\CEHv11\Module 12\Evading IDS, Firewalls, and Honeypots**

Lab Objectives

- Detect intrusions using Snort
- Detect malicious network traffic using ZoneAlarm FREE FIREWALL 2019
- Detect malicious network traffic using HoneyBOT

Lab Environment

To carry out this lab, you need:

- Windows 10 virtual machine

- Windows Server 2016 virtual machine
- Windows Server 2019 virtual machine
- Ubuntu virtual machine
- Parrot Security virtual machine
- Web browsers with an Internet connection
- Administrator privileges to run the tools
- Snort located at **E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort**
- ZoneAlarm FREE FIREWALL 2019 located at **E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Firewalls\ZoneAlarm FREE FIREWALL 2019**
- HoneyBOT located at **E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Honeypot Tools\HoneyBOT**
- You can also download the latest version of the above-mentioned tools from their official websites. If you decide to download the latest version, the screenshots shown in the lab might differ.

Lab Duration

Time: 55 Minutes

Overview of Intrusion Detection Systems

Intrusion detection systems are highly useful as they monitor both the inbound and outbound traffic of the network and continuously inspects the data for suspicious activities that may indicate a network or system security breach. The IDS checks traffic for signatures that match known intrusion patterns and signals an alarm when a match is detected. It can be categorized into active and passive, depending on its functionality: an IDS is generally passive and is used to detect intrusions, while an intrusion prevention system (IPS) is considered as an active IDS, as it is not only used to detect the intrusion on the network, but also prevent them.

Main Functions of IDS:

- Gathers and analyzes information from within a computer or a network, to identify the possible violations of security policy
- Also referred to as a “packet-sniffer,” which intercepts packets traveling along various communication mediums and protocols
- Evaluates traffic for suspected intrusions and signals an alarm after detection

Lab Tasks

T A S K 1

Detect Intrusions using Snort

Here, we will use Snort to detect network intrusions.

T A S K 1 . 1

Install Snort

 Snort is an open-source network intrusion detection system, capable of performing real-time traffic analysis and packet logging on IP networks.

 It can perform protocol analysis and content searching/matching and is used to detect a variety of attacks and probes such as buffer overflows, stealth port scans, CGI attacks, SMB probes, and OS fingerprinting attempts.

 Snort uses a flexible rules language to describe traffic to collect or pass, as well as a detection engine that utilizes a modular plug-in architecture.

T A S K 1 . 2

Verify Snort Alert

1. Turn on the **Windows 10** and **Windows Server 2019** virtual machines.
 2. In the **Windows Server 2019** virtual machine, log in with the credentials **Administrator** and **Pa\$\$w0rd**.
 3. Navigate to **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort** and double-click the **Snort_2_9_15_Installer.exe** file to start the Snort installation.
- Note:** If an **Open File - Security warning** pop-up window appears, click **Run**.
4. Accept the **License Agreement** and install Snort by selecting the default options that appear **step by step** in the wizard.
 5. A window appears after the successful installation of Snort; click **Close**.
 6. Click **OK** to exit the **Snort Installation** window.
- Note:** Snort requires **WinPcap** to be installed on your machine. In this lab environment, we have already installed WinPcap drivers for packet capturing.
7. By default, Snort installs itself in **C:\Snort** (C:\ or D:\, depending on the disk drive in which the OS is installed).
 8. Navigate to the **etc** folder in the specified location, **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort\snortrules-snapshot-29150\etc** of the Snort rules; copy **snort.conf** and paste it in **C:\Snort\etc**.
 9. **snort.conf** is already present in **C:\Snort\etc**; replace the file with the newly copied file.
 10. Copy the **so_rules** folder from **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort\snortrules-snapshot-29150** and paste into **C:\Snort**. The **so_rules** folder is already present in **C:\Snort**; replace this folder with the **so_rules** folder taken from the specified location.
 11. Copy the **preproc_rules** folder from **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort\snortrules-snapshot-29150**, and paste it into **C:\Snort**. The **preproc_rules** folder is already present in **C:\Snort**; replace this folder with the **preproc_rules** folder taken from the specified location.
 12. Using the same method, copy the **rules** folder from **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\Intrusion Detection Tools\Snort\snortrules-snapshot-29150** and paste into **C:\Snort**.
 13. Now right-click on the **Windows Start** icon and click **Run** from the menu.
 14. The **Run** window appears; type **cmd** in the **Open** field and click **OK** to launch command prompt window.

15. The **Command Prompt** window appears; type **cd C:\Snort\bin** and press **Enter** to access the bin folder in the command prompt.

```
Administrator: C:\Windows\system32\cmd.exe
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\Administrator>cd C:\Snort\bin
```

Figure 1.1.1: Accessing Snort Directory in Command Prompt

Uses of Snort:

- Straight packet sniffer such as tcpdump
- Packet logger (useful for network traffic debugging, etc.)
- Network intrusion prevention system.

16. Type **snort** and press **Enter**.

```
Administrator: C:\Windows\system32\cmd.exe - snort
C:\Snort\bin>snort
running in packet dump mode
--- Initializing Snort ---
[Initializing Output Plugins]
[cap DAQ configured to passive.

```

Figure 1.1.7: Snort.conf file in Notepad++

28. Scroll down to the **Step #1: Set the network variables** section (Line 41) of the **snort.conf** file. In the **HOME_NET** line (Line 45), replace **any** with the IP addresses of the machine (target machine) on which Snort is running. Here, the target machine is **Windows Server 2019** and the IP address is **10.10.10.19**.

Note: This IP address may vary in your lab environment.

29. Leave the **EXTERNAL_NET any** line as it is.
 30. If you have a **DNS Server**, then make changes in the **DNS_SERVERS** line by replacing **\$HOME_NET** with your DNS Server IP address; otherwise, leave this line as it is.

Note: Here, the DNS server is **8.8.8.8**.

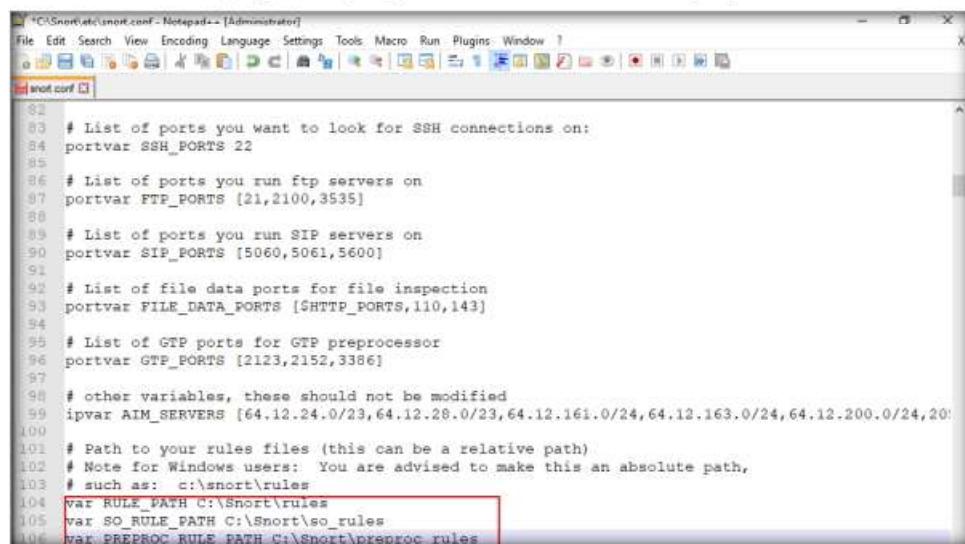

```

40 ##### Step #1: Set the network variables. For more information, see README.variables
41 # Setup the network addresses you are protecting
42 ipvar HOME_NET 10.10.10.19
43
44 # Set up the external network addresses. Leave as "any" in most situations
45 ipvar EXTERNAL_NET any
46

103 # such as: c:\snort\rules
104 var RULE_PATH C:\Snort\rules
105 var SO_RULE_PATH C:\Snort\so_rules
106 var PREPROC_RULE_PATH C:\Snort\preproc_rules
  
```

Figure 1.1.9: Snort Rules Path

34. In Lines 109 and 110, replace `..rules` with `C:\Snort\rules`. Minimize the **Notepad++** window.

```

104 var RULE_PATH C:\Snort\rules
105 var SO_RULE_PATH C:\Snort\so_rules
106 var PREPROC_RULE_PATH C:\Snort\preproc_rules
107
108 # If you are using reputation preprocessor set these
109 var WHITE_LIST_PATH C:\Snort\rules
110 var BLACK_LIST_PATH C:\Snort\rules
111

```

Figure 1.1.10: Snort Rules Path

35. Navigate to `C:\Snort\rules`, and create two text files; name them `white_list` and `black_list` and change their file extensions from `.txt` to `.rules`.

Note: To create a text file, right-click anywhere inside the **rules** window and navigate to **New → Text Document**.

36. While changing the extension, if any pop-up appears, click **Yes**.
37. Switch back to **Notepad ++**, scroll down to the **Step #4: Configure dynamic loaded libraries** section (Line 238). **Configure dynamic loaded libraries** in this section.
38. Add the path to dynamic processor libraries (Line 243); replace `/usr/local/lib/snort_dynamicpreprocessor` with your dynamic processor libraries folder location.
39. In this lab, the dynamic processor libraries are located at `C:\Snort\lib\snort_dynamicpreprocessor`.
40. At the path to base processor (or dynamic) engine (Line 246), replace `/usr/local/lib/snort_dynamicengine/libsf_engine.so` with your base processor engine `C:\Snort\lib\snort_dynamicengine\sf_engine.dll`.
41. Ensure that the dynamic rules libraries (Line 250) is commented out, as you have already configured the libraries in dynamic processor libraries.

Note: Add `<space>` in between `#` and `dynamicdetection` (Line 250).

```

237 #####
238 # Step #4: Configure dynamic loaded libraries.
239 # For more information, see Snort Manual, Configuring Snort - Dynamic Modules
240 #####
241
242 # path to dynamic processor libraries
243 dynamicpreprocessor directory C:\Snort\lib\snort_dynamicpreprocessor
244
245 # path to base processor engine
246 dynamicengine C:\Snort\lib\snort_dynamicengine\sf_engine.dll
247
248 # path to dynamic rules libraries (Shared Object (SO) Rules)
249 # Set this path to where the compiled *.so binaries are installed
250 # dynamicdetection directory /usr/local/lib/snort_dynamicrules
251

```

Figure 1.1.11: Configuring Dynamic Loaded Libraries

42. Scroll down to the **Step #5: Configure preprocessors** section (Line 253), the listed preprocessor. This does nothing in IDS mode, however, it generates errors at runtime.
43. Comment out all the preprocessors listed in this section by adding '#' and <space> before each preprocessor rule (262-266).

Note: To ‘comment out’ is to render a block of code inert by turning it into a comment.

The screenshot shows a Notepad++ window with the file 'snort.conf' open. A red box highlights the following code block:

```
252 #####  
253 # Step #5: Configure preprocessors  
254 # For more information, see the Snort Manual, Configuring Snort - Preprocessors  
255 #####  
256  
257 # GTP Control Channel Preprocessor. For more information, see README.GTP  
258 # preprocessor gtp: ports { 2123 3386 2152 }  
259  
260 # Inline packet normalization. For more information, see README.normalize  
261 # Does nothing in IDS mode  
262 # preprocessor normalize_ip4  
263 # preprocessor normalize_tcp: block, rsv, pad, urp, req_urg, req_pay, req_urp, ips, ecn stream  
264 # preprocessor normalize_icmp4  
265 # preprocessor normalize_ip6  
266 # preprocessor normalize_icmp6
```

Figure 1.1.12: Configuring Preprocessors

44. Scroll down to line 326 and delete **lzma** keyword and a <space>.

The screenshot shows a Notepad++ window with the file 'snort.conf' open. A red box highlights the word 'lzma' in the line 'decompress_swf { deflate lzma }'. A callout bubble points to this word with the text 'Delete only lzma from this line.'.

```
324 u_encode yes \  
325 webroot no \  
326 decompress_swf { deflate lzma } Delete only lzma from this line.  
327 decompress_pdf { deflate }
```

Figure 1.1.13: Deleting lzma

45. Scroll down to **Step #6: Configure output plugins** (Line 513). In this step, provide the location of the **classification.config** and **reference.config** files.
46. These two files are in **C:\Snort\etc**. Provide this location of files in the configure output plugins (in Lines 532 and 533) (i.e., **C:\Snort\etc\classification.config** and **C:\Snort\etc\reference.config**).

```
*C:\Snort\etc\snort.conf - Notepad++ [Administrator]
File Edit Search View Encoding Language Settings Tools Macro Run Plugins Window ?
snort.conf

512 #####
513 # Step #6: Configure output plugins
514 # For more information, see Snort Manual, Configuring Snort - Output Modules
515 #####
516
517 # unified2
518 # Recommended for most installs
519 # output unified2: filename merged.log, limit 128, nostamp, mpls_event_types, vlan_ev
520
521 # Additional configuration for specific types of installs
522 # output alert_unified2: filename snort.alert, limit 128, nostamp
523 # output log_unified2: filename snort.log, limit 128, nostamp
524
525 # syslog
526 # output alert_syslog: LOG_AUTH LOG_ALERT
527
528 # pcap
529 # output log_tcpdump: tcpdump.log
530
531 # metadata reference data. do not modify these lines
532 include C:\Snort\etc\classification.config
533 include C:\Snort\etc\reference.config
534
```

Figure 1.1.14: Configuring output plugins

47. In **Step #6**, add to line (534) **output alert_fast: alerts.ids**: this command orders Snort to dump all logs into the **alerts.ids** file.

```
*C:\Snort\etc\snort.conf - Notepad++ [Administrator]
File Edit Search View Encoding Language Settings Tools Macro Run Plugins Window ?
snort.conf

512 #####
513 # Step #6: Configure output plugins
514 # For more information, see Snort Manual, Configuring Snort - Output Modules
515 #####
516
517 # unified2
518 # Recommended for most installs
519 # output unified2: filename merged.log, limit 128, nostamp, mpls_event_types, vlan_ev
520
521 # Additional configuration for specific types of installs
522 # output alert_unified2: filename snort.alert, limit 128, nostamp
523 # output log_unified2: filename snort.log, limit 128, nostamp
524
525 # syslog
526 # output alert_syslog: LOG_AUTH LOG_ALERT
527
528 # pcap
529 # output log_tcpdump: tcpdump.log
530
531 # metadata reference data. do not modify these lines
532 include C:\Snort\etc\classification.config
533 include C:\Snort\etc\reference.config
534 output alert_fast: alerts.ids
535
```

Figure 1.1.15: Adding output alert

48. In the **snort.conf** file, find and replace the **ipvar** string with **var**. To do this, press **Ctrl+H** on the keyboard. The **Replace** window appears; enter **ipvar** in the **Find what :** text field, enter **var** in the **Replace with :** text field, and click **Replace All**.

Note: You will get a notification saying 11 occurrences were replaced.

49. By default, the string is **ipvar**, which is not recognized by Snort: replace with the **var** string, and then **close** the window.

Note: Snort now supports multiple configurations based on VLAN Id or IP subnet within a single instance of Snort. This allows administrators to specify multiple snort configuration files and bind each configuration to one or more VLANs or subnets rather than running one Snort for each configuration required.

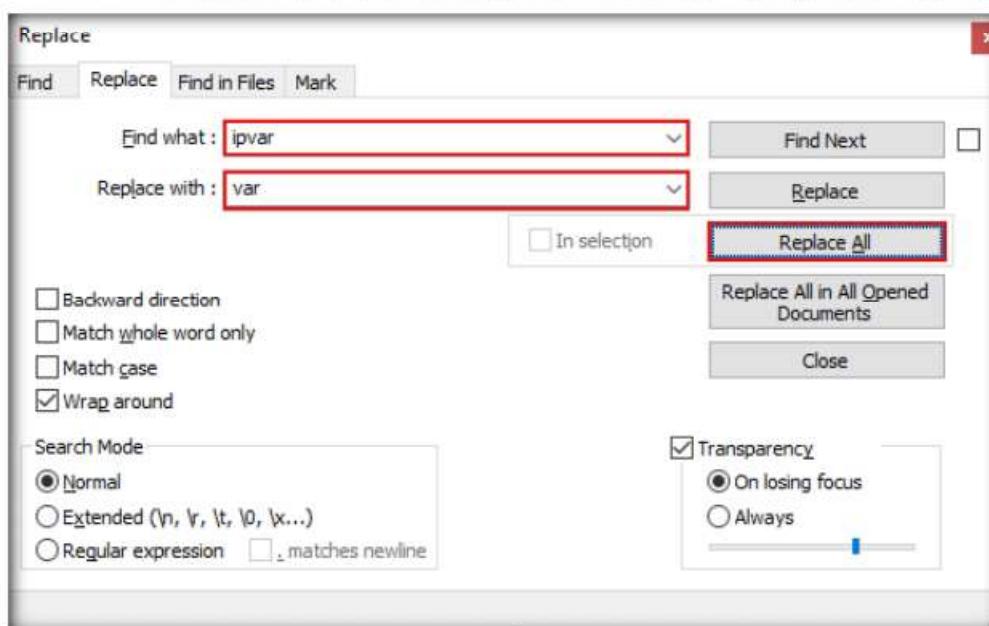

Figure 1.1.16: Replacing ipvar with var

50. Click **Close** to close the **Replace** window.
51. Save the **snort.conf** file by pressing **Ctrl+S** and close Notepad++ window.
52. Before running Snort, you need to enable detection rules in the Snort rules file. For this task, we have enabled the ICMP rule so that Snort can detect any host discovery ping probes directed at the system running Snort.
53. Navigate to **C:\Snort\rules** and open the **icmp-info.rules** file with **Notepad ++**.

54. In line 21, type `alert icmp $EXTERNAL_NET any -> $HOME_NET
10.10.10.19 (msg:"ICMP-INFO PING"; icode:0; itype:8;
reference:arachnids,135; reference:cve,1999-0265; classtype:bad-
unknown; sid:472; rev:7;)` and save. Close the **Notepad++** window.

Note: The IP address (10.10.10.19) mentioned in \$HOME_NET may vary in your lab environment.

```

Figure 1.1.17: Adding a line to ICMP - Info.rules file in Notepad++

 TASK 1-4

Validate Configurations

55. Now right-click on the **Windows Start** icon and click **Run** from the menu.
 56. In the **Run** window, type **cmd** in the **Open** field and press **Enter**. This will launch a command prompt window.
 57. In the command prompt window, type **cd C:\Snort\bin** and press **Enter**.
 58. Type **snort -iX -A console -c C:\Snort\etc\snort.conf -l C:\Snort\log -K ascii** and press **Enter** to start Snort (replace **X** with your device index number; in this lab: **X** is 1).

```
C:\Snort\bin>snort -i1 -A console -c C:\Snort\etc\snort.conf -l C:\Snort\log -K ascii
```

Figure 1.1.18: Command to activate Snort and save the stored log files

Page 15

Start Sport

59. If you receive a **fatal error**, you should first **verify** that you have typed all modifications correctly into the **snort.conf** file, and then search through the file for **entries** matching your fatal error message.
 60. If you receive an error stating “**Could not create the registry key**,” then run the command prompt as **Administrator**.
 61. Snort starts running in IDS mode. It first initializes output plug-ins, preprocessors, plug-ins, loads dynamic preprocessors libraries, rule chains of Snort, and then logs all signatures.

62. If you have entered all command information correctly, you receive a comment stating **Commencing packet processing <pid=xxxx>** (the value of xxxx may be any number; in this lab, it is 1464), as shown in the screenshot.

```
Administrator: C:\Windows\system32\cmd.exe - snort -iT -A console -c C:\Snort\etc\snort.conf -l C:\Snort\log -K ascii
Acquiring network traffic from "\Device\NPF_{EC2BC073-AFB2-4670-A3E7-7A9760167573}".

```

Figure 1.1.19: Initializing Snort Rule Chains window

63. After initializing interface and logged signatures, Snort starts and waits for an attack and triggers alerts when attacks occur on the machine.
64. Leave the Snort command prompt running.
65. Attack your own machine, and check whether Snort detects it or not.
66. Now, switch to the **Windows 10** virtual machine (**Attacker Machine**) and log in with the credentials **Admin** and **Pa\$\$w0rd**.
67. Open the command prompt and issue the command **ping 10.10.10.19 -t** from the **Attacker Machine**.

Note: **10.10.10.19** is the IP address of the Windows Server 2019. This IP address may differ in your lab environment.

```
C:\WINDOWS\system32\cmd.exe - ping 10.10.10.19 -t
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\Admin>ping 10.10.10.19 -t

Pinging 10.10.10.19 with 32 bytes of data:
Reply from 10.10.10.19: bytes=32 time<1ms TTL=128
Reply from 10.10.10.19: bytes=32 time<1ms TTL=128
```

Figure 1.1.20: Pinging the target machine

68. Return to the **Windows Server 2019** machine. Observe that Snort triggers an alarm, as shown in the screenshot:

```
[Administrator: C:\Windows\system32\cmd.exe] snort -i1 -A console -c C:\Snort\etc\snort.conf -l C:\Snort\log\Kascii

Figure 1.1.23: Saved Snort logs

Note: This means that whenever an attacker attempts to connect or communicate with the machine, Snort immediately triggers an alarm.

Note: This will make you aware of the intrusion and can thus take certain security measures to disconnect the lines of communication with the attacker's machine.

71. Close all open windows in the **Windows 10** and **Windows Server 2019** virtual machines and shut down the **Windows Server 2019** virtual machine.

TASK 2

Detect Malicious Network Traffic using ZoneAlarm FREE FIREWALL 2019

Note: Ensure that the **Windows 10** virtual machine is running.

1. Launch the **Windows Server 2019** virtual machine.
 2. Before starting this task, we will browse an unwanted website in the **Windows 10** machine. Assume that **www.moviescope.com** is an unwanted site that is not supposed to be browsed in your network.

Note: www.moviescope.com is a local website that is hosted and configured in the **Windows Server 2019** machine.

3. In the **Windows 10** machine, open any browser (here, **Google Chrome**) and type **www.moviescope.com** in the address bar and press **Enter**.

 ZoneAlarm FREE Firewall 2019 blocks attackers and intruders from accessing your system. It manages and monitors all incoming and outgoing traffic and shields the network from hackers, malware, and other online threats that put network privacy at risk, and monitors programs for suspicious behavior spotting and stopping new attacks that bypass traditional anti-virus protection.

4. As you can observe that **www.moviescope.com** can be browsed in the **Windows 10** machine.
5. In this task, we are going to block this site from browsing. Close the **Google Chrome** browser.

T A S K 2 . 1

**Browse
MovieScope
Website**

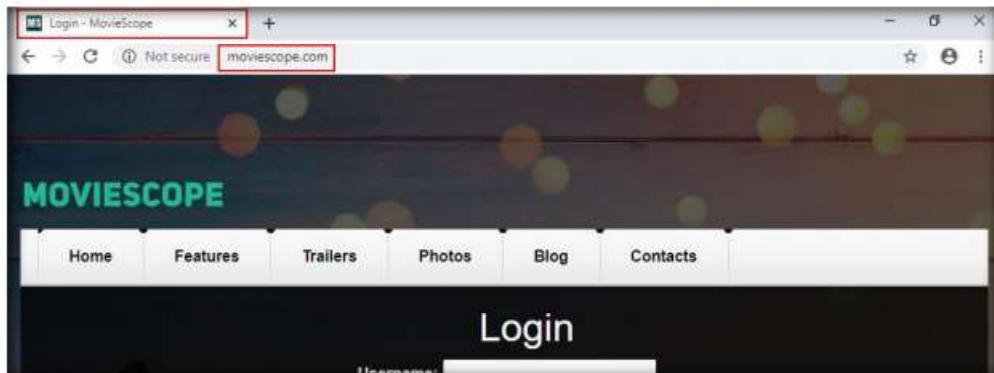

Figure 1.2.1: www.moviescope.com site accessible

T A S K 2 . 2**Install ZoneAlarm Firewall**

ZoneAlarm FREE Firewall 2019 prevents identity theft by guarding your data, and erases your tracks allowing you to surf the web in complete privacy. Furthermore, it locks out attackers, blocks intrusions, and makes your PC invisible online. Additionally, it filters out annoying, as well as potentially dangerous, email.

Figure 1.2.2: ZoneAlarm Custom Install

9. The **End User License Agreement** wizard appears; click **Agree >**.

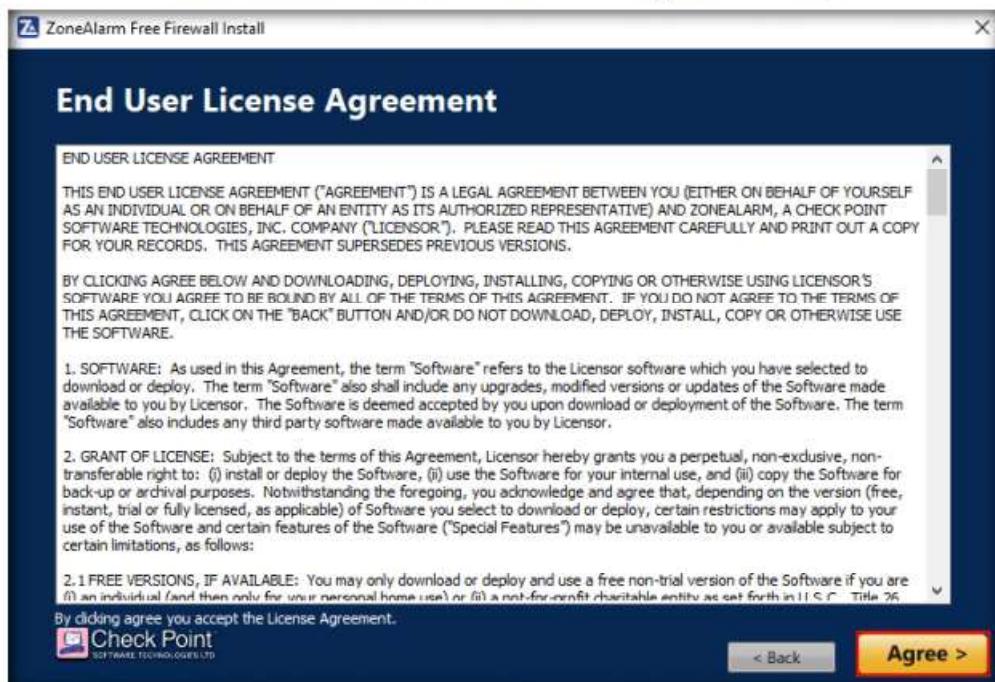

Figure 1.2.3: ZoneAlarm License Agreement

10. In the **Application Control Mode** wizard, ensure that the **Set Application Control to AUTO-LEARN mode** option is selected, and click **Next >**.
11. By choosing this mode, Zone Alarm Firewall configures the security settings based on behavior and automates this process for your network.

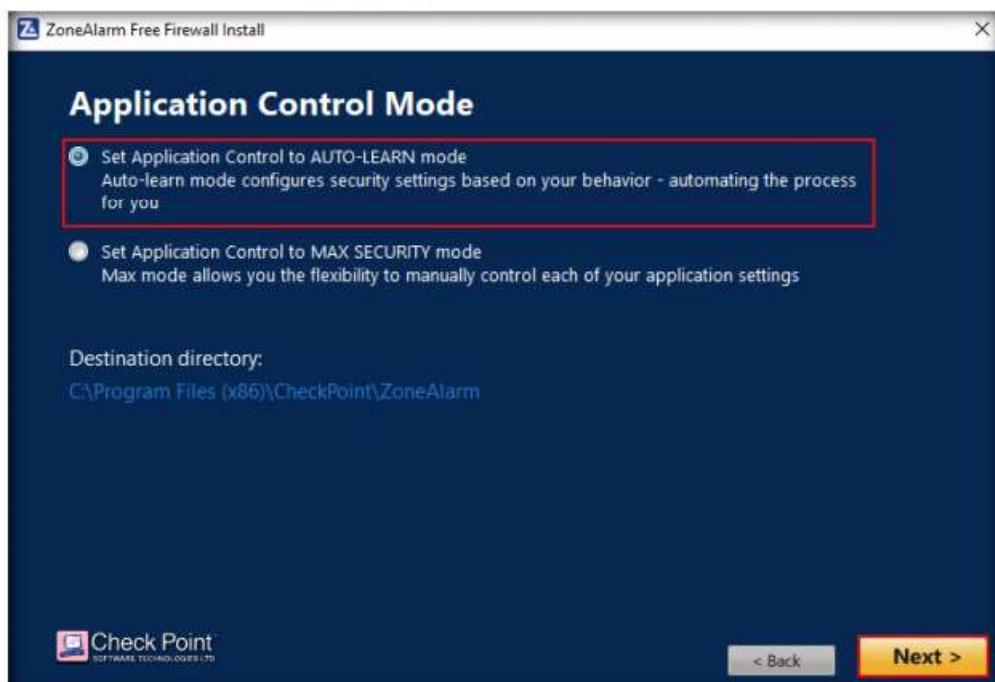

Figure 1.2.4: ZoneAlarm Application Control Mode

12. Click the **Skip** button in the **Add our Free Chrome Extension for Safer Browsing** wizard.

Note: If you wish to enable this option, click **Add to Chrome**. In this task, we are choosing to skip this option.

Figure 1.2.5: ZoneAlarm Chrome Extension

13. ZoneAlarm Free Firewall starts downloading and configuring the components to your machine.
14. Wait until the installation is completed: this may take a few minutes to install.

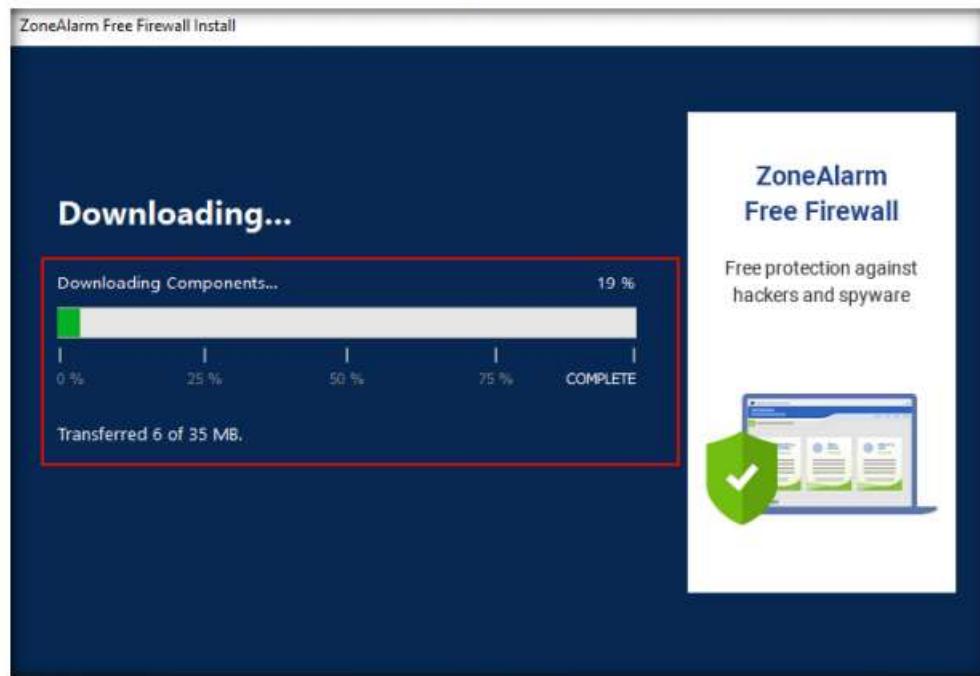

Figure 1.2.6: ZoneAlarm Downloading Components

15. The **Installation was Successful!** wizard appears; click **FINISH**.
16. As soon as you click the **Finish** button, the ZoneAlarm webpage opens in your default browser window; close the browser.

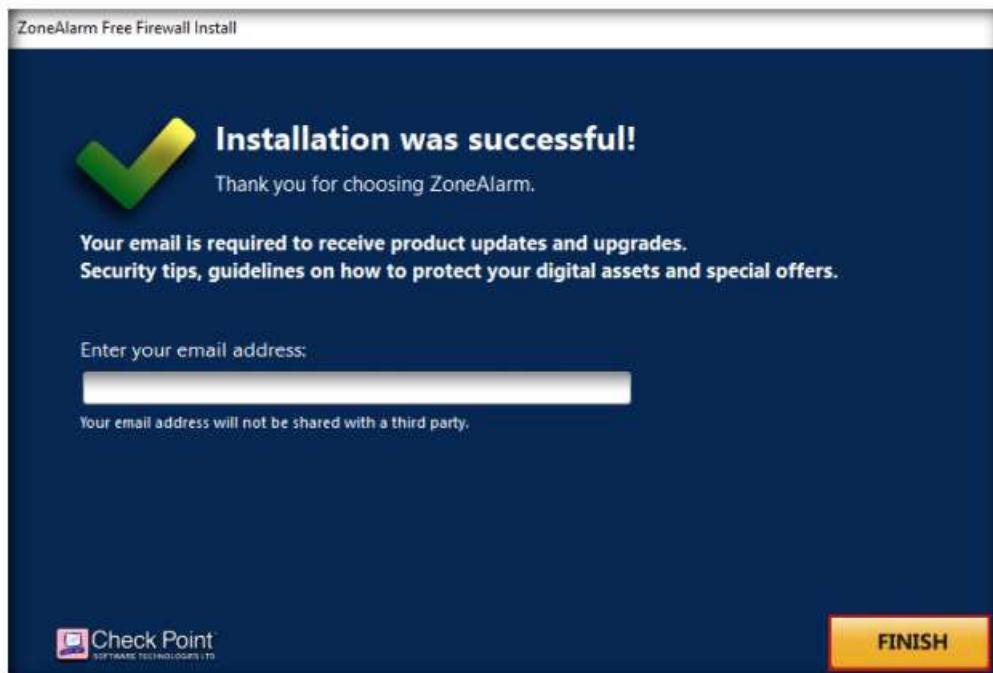

Figure 1.2.7: ZoneAlarm installation success

T A S K 2 . 3

Configure ZoneAlarm Firewall

Figure 1.2.8: ZoneAlarm main window

18. In the **FIREWALL** tab, click **View Zones** under the **Basic Firewall** section.

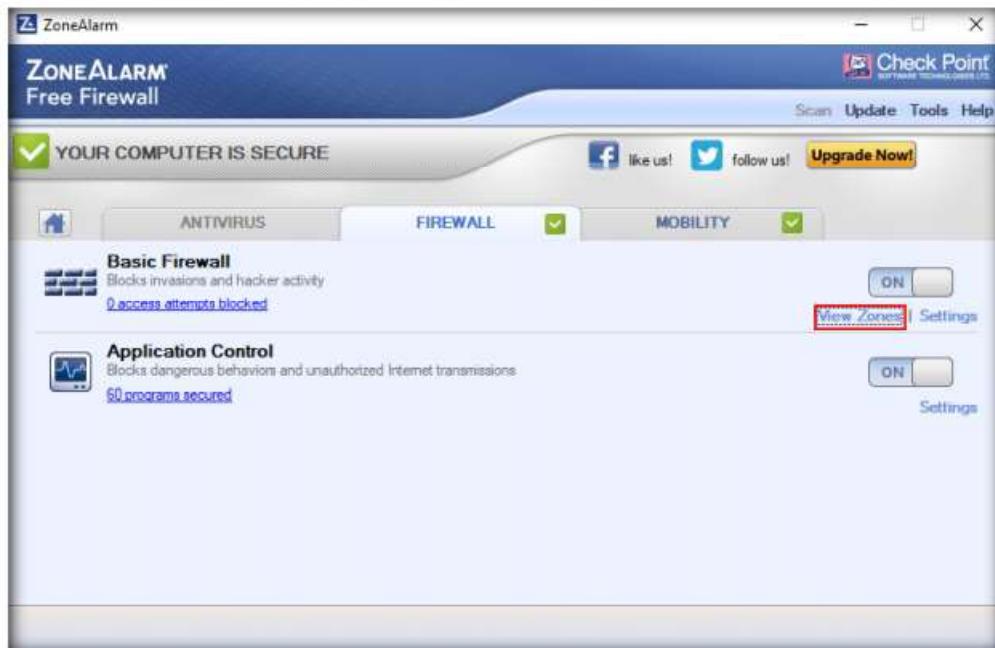

Figure 1.2.9: ZoneAlarm Firewall settings

T A S K 2 . 4

View Zones

19. The **Firewall Settings** window appears with the **View Zones** tab selected; click **Add >>** and click the **Host/Site** option from the menu, as shown in the screenshot.

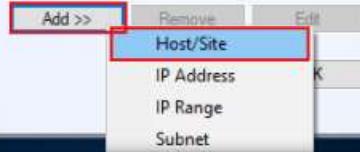

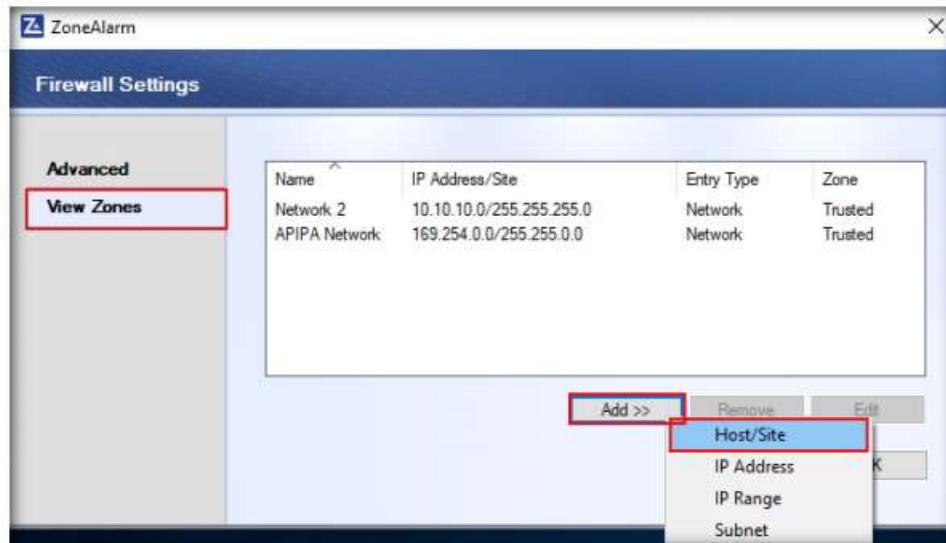

Figure 1.2.10: ZoneAlarm View Zones

20. The **Add Zone** window appears; choose the following:

- a. Zone: **Blocked**
- b. Hostname: **www.moviescope.com**
- c. Description: **Block This Site**

- d. Click **Lookup**; by doing this, we are blocking unwanted sites from browsing
21. You can provide any site that you wish to block.

Note: **www.moviescope.com** is the local website that is configured on Windows Server 2019.

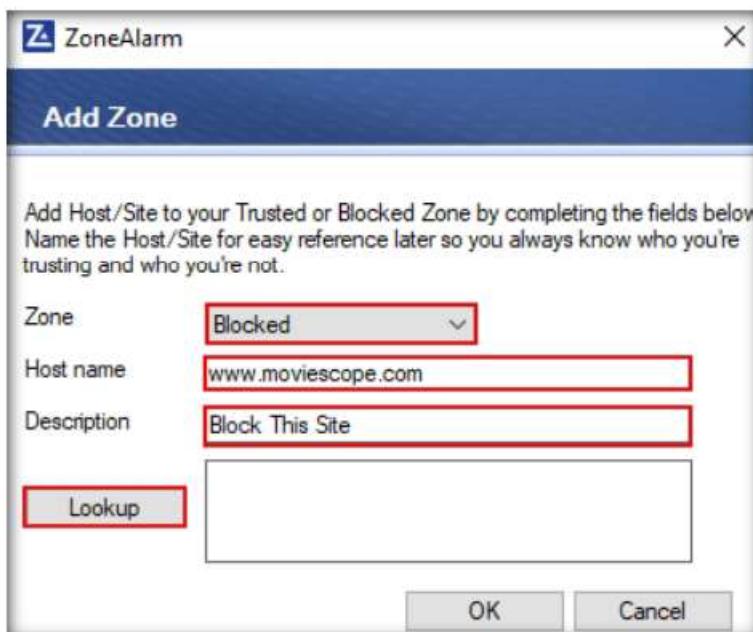

Figure 1.2.11: ZoneAlarm Adding Zone

22. As soon as you click **Lookup**, the IP address of **www.moviescope.com** appears in the text field; click **OK**.

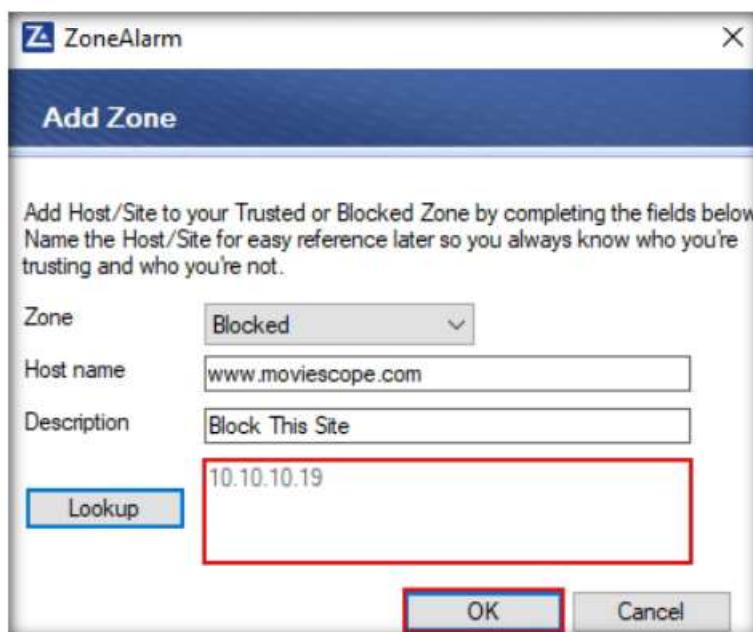

Figure 1.2.12: ZoneAlarm Adding Zone

23. The newly added rule appears in the **View Zones** section, as shown in the screenshot; click **OK**.

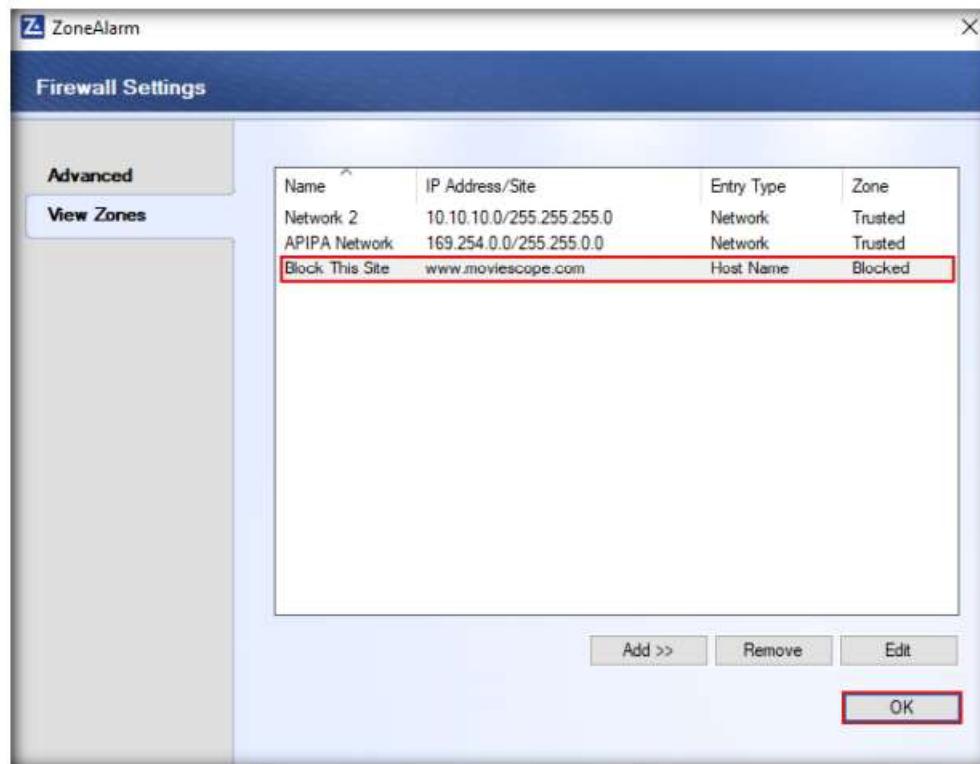

Figure 1.2.13: ZoneAlarm newly created rule

24. Open any browser (here, **Google Chrome**) and now try to browse the blocked website, that is, www.moviescope.com.
 25. As you have created a rule in ZoneAlarm Firewall to block **www.moviescope.com** from browsing, you will receive a message as **Your Internet access is blocked**.

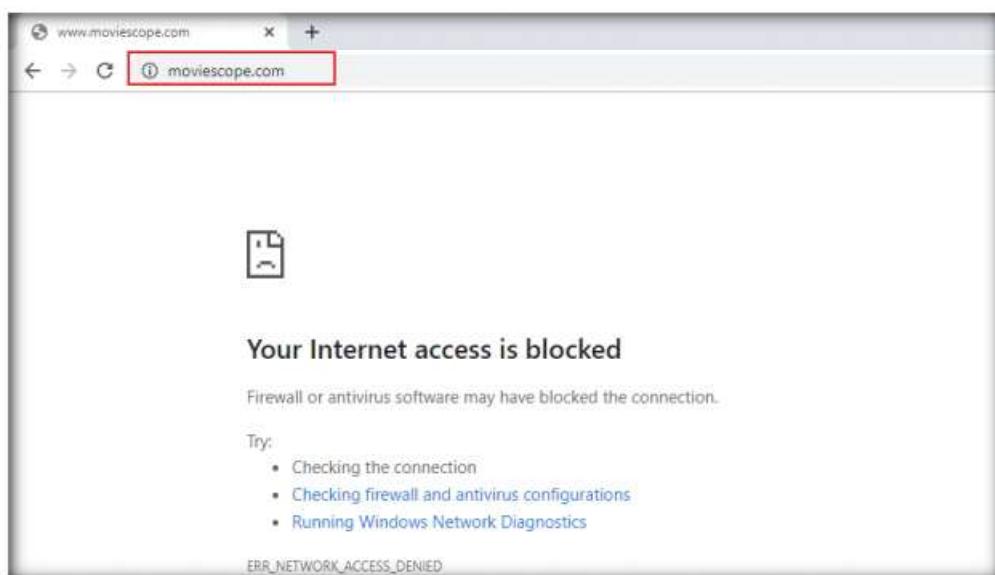

Figure 1.2.14: www.moviescope.com site blocked

Note: This is how you can block access for unwanted sites from browsing.

26. Before proceeding for the next task, go to the **ZoneAlarm Firewall Settings** window, select the newly created rule in the **View Zones** section, click **Remove**, and click **OK**.

Note: If a **Delete Confirmation** pop-up appears, click **Yes**.

27. This will remove the block access for the **www.moviescope.com** site.

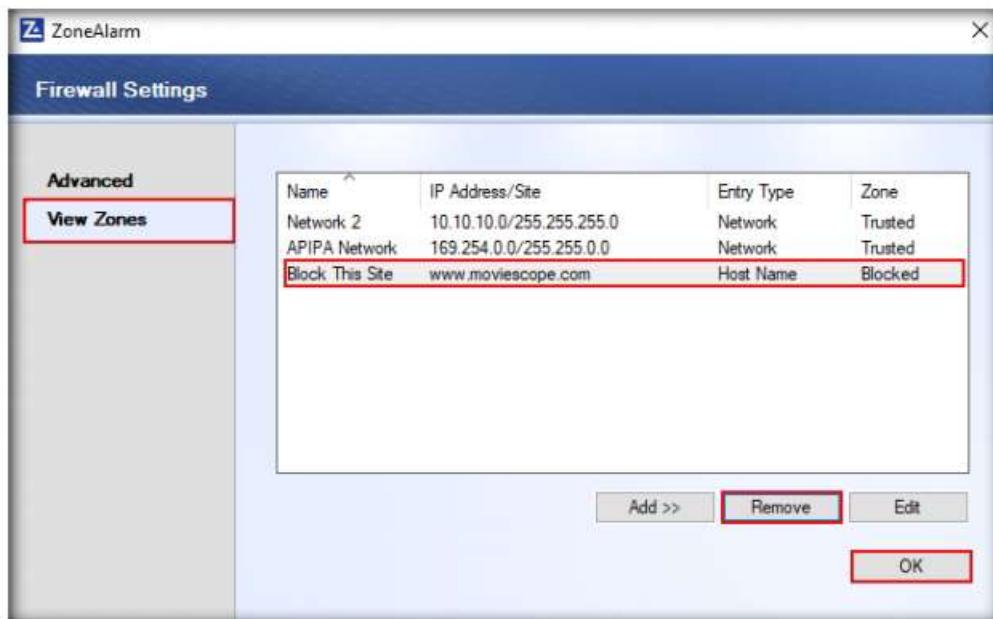

Figure 1.2.15: ZoneAlarm removing www.moviescope.com from block list

28. Close the ZoneAlarm main window.
 29. Click **Show hidden icon** (↗) from the lower right section of **Desktop**. Right-click the **ZoneAlarm** icon and click **Exit** from the context menu.
- Note:** If a **Shut down** pop-up appears, click **Yes**.
30. Restart the **Windows 10** virtual machine.
 31. After the system reboots, log in with the credentials **Admin** and **Pa\$\$w0rd**.
 32. **Uninstall** ZoneAlarm in the **Windows 10** machine. To do so, launch **Control Panel → Programs and Features**. In the **Programs and Features** window, choose **ZoneAlarm Free Firewall** and click **Uninstall**. Follow the wizard-driven uninstallation process to remove ZoneAlarm from the **Windows 10** machine.
 33. After the uninstallation is completed, you will receive a prompt to restart the machine; click **Yes** to restart.
 34. Once the system reboots, turn off the **Windows Defender Firewall**.
 - a. In the **Windows Defender Firewall** window, click the **Turn Windows Defender Firewall on or off** link in the left pane of the window

You can also use other firewalls such as **ManageEngine Firewall Analyzer** (<https://www.manageengine.com>), **pfSense** (<https://www.pfsense.org>), **Sophos XG Firewall** (<https://www.sophos.com>), and **Comodo Firewall** (<https://personalfirewall.comodo.com>) to block access to a particular website or IP address.

- b. In the **Customise Settings** window, select the **Turn off Windows Defender Firewall (not recommended)** radio button for all Domain, Private and Public network settings, and then click **OK**
 - c. Again, in the **Windows Defender Firewall** window, click **Advanced settings** link in the left pane
 - d. Once the **Windows Defender Firewall with Advanced Security** appears on the screen, click the **Windows Defender Firewall Properties** link in the **Overview** section
 - e. The **Windows Defender Firewall with Advanced Security on Local Computer Properties** window appears; in the **Domain Profile** tab, choose **Off** from the **Firewall state** drop-down list. Then, navigate to the **Private Profile** and **Public Profile** tabs and ensure that the **Firewall state** is **Off**. Click **Apply**, and then click **OK**
35. Close all open windows.
 36. Turn off the **Windows Server 2019** virtual machine.

T A S K 3

Detect Malicious Network Traffic using HoneyBOT

Here, we will use the HoneyBOT tool to detect malicious network traffic.

Note: Ensure that the **Windows 10** virtual machine is running.

HoneyBOT is a medium interaction honeypot for windows. A honeypot creates a safe environment to capture and interact with unsolicited traffic on a network. HoneyBOT is an easy-to-use solution that is ideal for network security research or as part of an early-warning IDS.

1. Turn on the **Windows Server 2016** and **Parrot Security** virtual machines.
2. In the **Windows Server 2016** virtual machine, log in with the credentials **Administrator** and **Pa\$\$w0rd**.
3. Navigate to **Z:\CEHv11\Module 12 Evading IDS, Firewalls, and Honeypots\Honeypot Tools\HoneyBOT**. Double-click **HoneyBOT_018.exe** to launch the HoneyBOT installer. Follow the wizard-driven steps to install HoneyBOT.

Note: If the **User Account Control** window appears, click **Yes**.

4. Once the installation of HoneyBOT completes, in the **Completing the HoneyBot Setup Wizard** window, uncheck the **Launch HoneyBOT** option, click **Finish**.
5. Now, click the **Start** icon from the left-bottom of **Desktop**. Under **Recently added** applications, right-click **HoneyBOT** → **More** → **Run as administrator**, as shown in the screenshot.

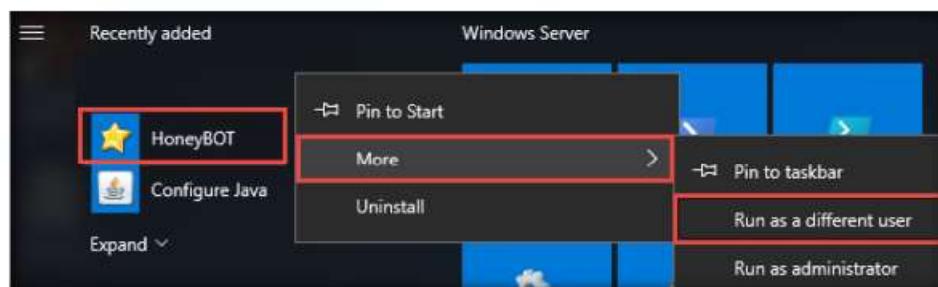

Figure 1.3.1: Launch HoneyBOT

6. The **HoneyBOT** configuration pop-up appears; click **Yes** to configure HoneyBOT.

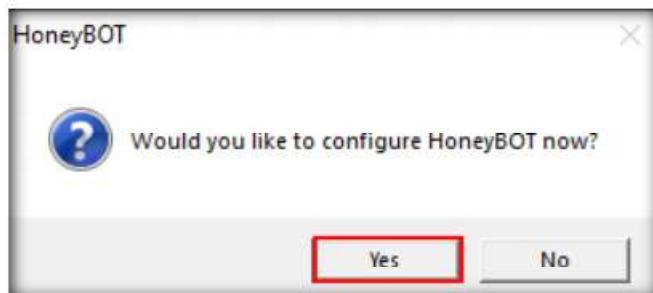

Figure 1.3.2: HoneyBOT configuration pop-up

7. The HoneyBOT **Options** window appears with default options checked on the **General** settings tab. Leave the default settings or modify them accordingly.
8. In this task, we are leaving the settings on default for the **General** tab in the **Options** window.

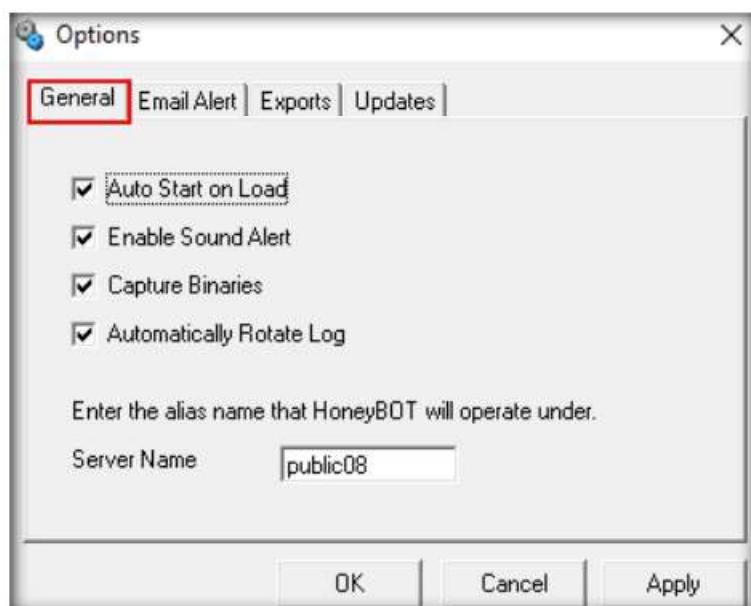

Figure 1.3.3: HoneyBOT Options-General

9. Click the **Email Alert** tab; if you want HoneyBOT to send you email alerts, check **Send Email Alerts**, and fill in the respective fields.

Note: In this task, we will not be providing any details for email alerts.

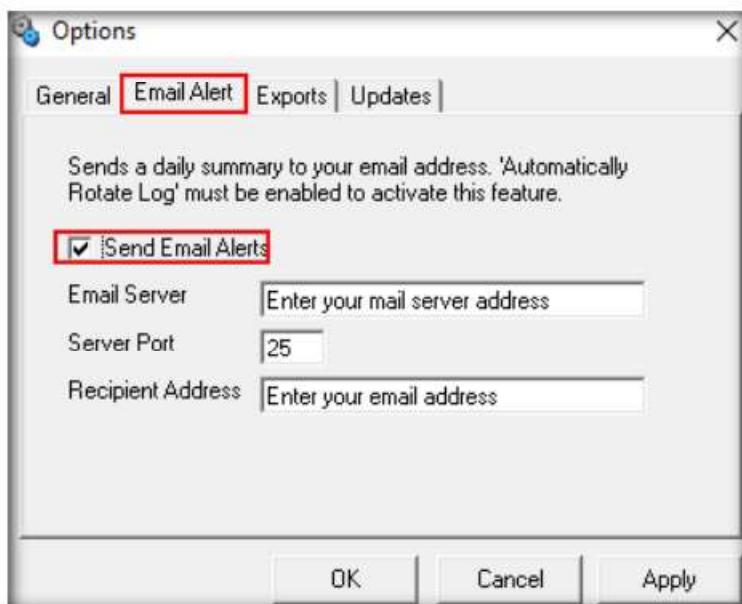

Figure 1.3.4: HoneyBOT Options-Email Alert

10. On the **Exports** tab, in which you can export the logs recorded by HoneyBOT, choose the required option to view the reports, and then proceed to the next step.

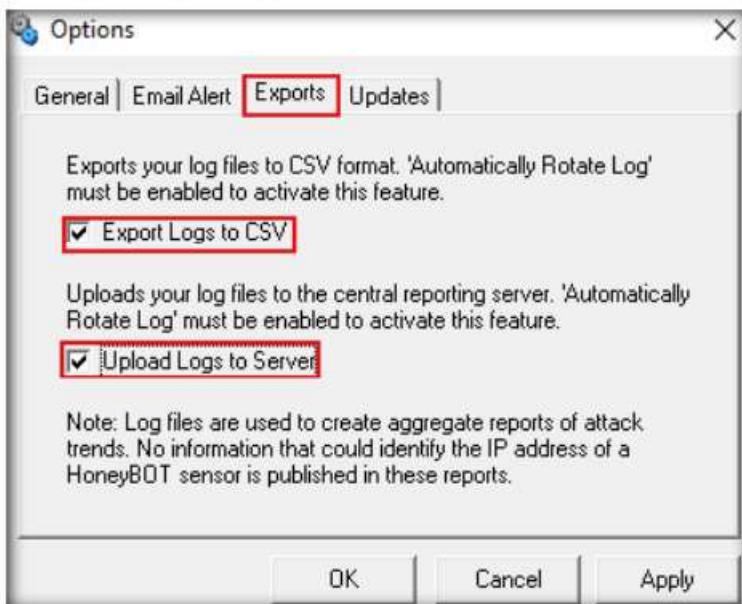

Figure 1.3.5: HoneyBOT Options-Exports

11. On the **Updates** tab, uncheck **Check for Updates**; click **Apply** and click **OK** to continue.

Note: If a **Bindings** pop-up appears, click **OK** to continue.

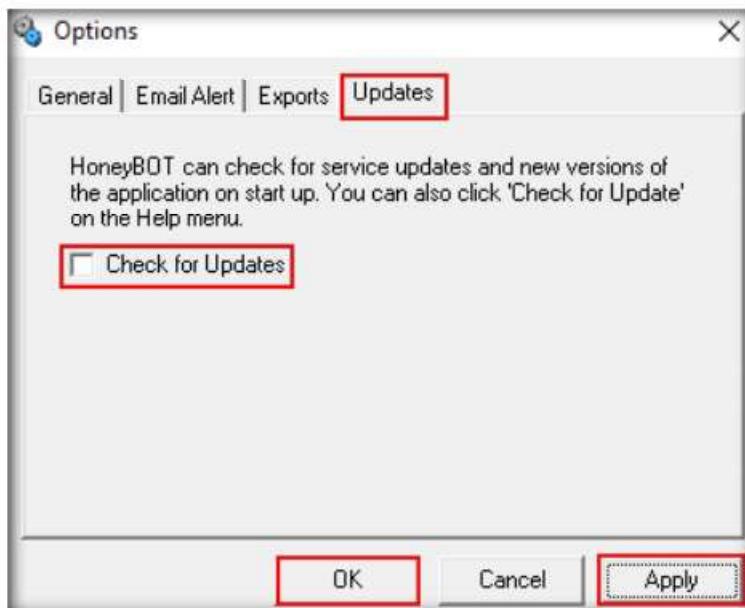

Figure 1.3.6: HoneyBOT Options-Updates

12. The **HoneyBOT** main window appears, as shown in the screenshot.
13. Now, leave the HoneyBOT window running on **Windows Server 2016**.

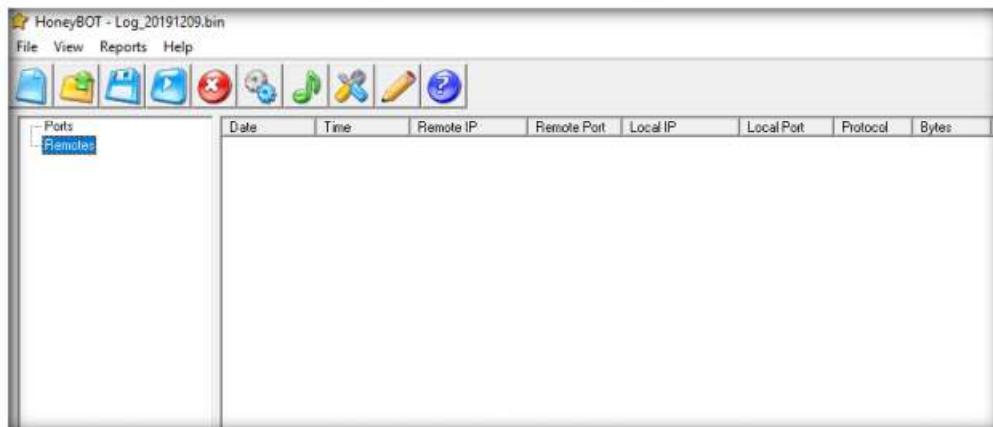

Figure 1.3.7: HoneyBOT main window

14. Switch to the **Parrot Security** virtual machine.
15. In the login page, the **attacker** username will be selected by default. Enter password as **toor** in the **Password** field and press **Enter** to log in to the machine.

Note:

- If a **Parrot Updater** pop-up appears at the top-right corner of **Desktop**, ignore and close it.

- If a **Question** pop-up window appears asking you to update the machine, click **No** to close the window.
- Click the **MATE Terminal** icon at the top of the **Desktop** window to open a **Terminal** window.
 - A **Parrot Terminal** window appears. In the terminal window, type **sudo su** and press **Enter** to run the programs as a root user.
 - In the **[sudo] password for attacker** field, type **toor** as a password and press **Enter**.

Note: The password that you type will not be visible.

- Now, type **cd** and press **Enter** to jump to the root directory.

```
Parrot Terminal
File Edit View Search Terminal Help
[attacker@parrot] ~ $ sudo su
[sudo] password for attacker:
[root@parrot] /home/attacker #
#cd
[root@parrot] ~ #
#
```

Figure 1.3.8: Running the programs as a root user

- In the terminal window, type **ftp <IP Address of the Windows Server 2016 machine>** and press **Enter**.
- You will be prompted for the ftp credentials of the **Windows Server 2016** machine.
- In this task, the IP address of **Windows Server 2016** is **10.10.10.16**; this may differ in your lab environment.

Note: If Parrot Security sends an error message stating that the **ftp** command is not found, then install **ftp** with the “**apt-get install ftp**” command.

```
Parrot Terminal
File Edit View Search Terminal Help
#ftp 10.10.10.16
Connected to 10.10.10.16.
220 PUBLIC08 FTP Service (Version 5.0).
Name (10.10.10.16:root):
```

Figure 1.3.9: Running ftp command in Parrot Security

- Return to the **Windows Server 2016** virtual machine. In the **HoneyBOT** window, expand the **Ports** and **Remotes** node from the left-pane.
- Under **Ports**, you can see the port numbers from which **Windows Server 2016** received requests or attacks.

25. Under **Remotes**, you can view the recorded IP addresses through which Windows Server 2016 received requests.

26. Now, right-click any IP address or Port on the left, and click **View Details**, as shown in the screenshot, to view the complete details of the request or attack recorded by HoneyBOT.

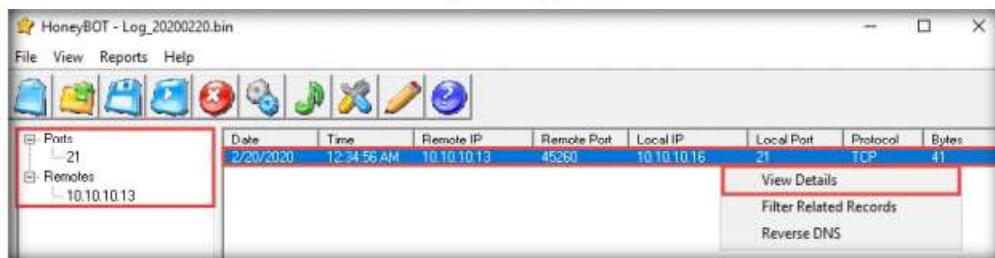

Figure 1.3.10: HoneyBOT captured traffic

27. The **Packet Log** window appears, as shown in the screenshot. This displays the complete log details of the request captured by HoneyBOT.

28. In the screenshot, under **Connection Details**, you can view the Date and Time of the connection established as well as the protocol used.

29. **Connection Details** also shows the Source IP, Port, and Server Port, as shown below.

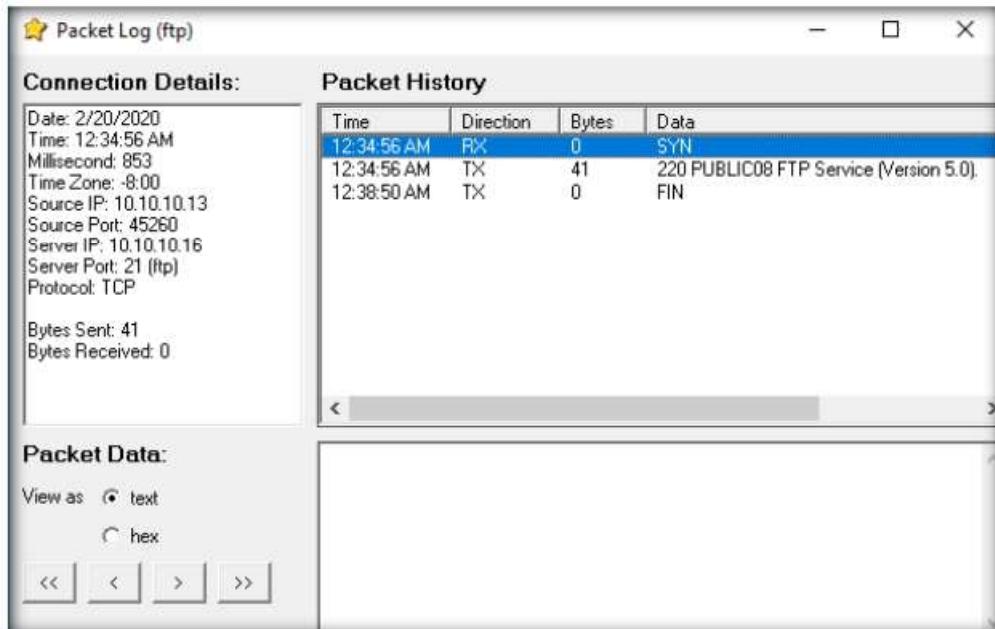

Figure 1.3.11: HoneyBOT packet log information

30. Simultaneously, you can run the telnet command on the **Parrot Security** machine and observe the log recorded by **HoneyBOT** on **Windows Server 2016**.

31. Close all open windows in the **Windows Server 2016**, **Windows 10** and **Parrot Security**.

32. Turn off the **Parrot Security**, **Windows 10**, and **Windows Server 2019** virtual machines.

Lab**2**

Evade Firewalls using Various Evasion Techniques

Bypassing a firewall is a technique where an attacker manipulates the attack sequence to avoid being detected by the underlying security firewall.

ICON KEY

Valuable information

Test your knowledge

Web exercise

Workbook review

Lab Scenario

Firewalls and IDSs are intended to prevent port scanning tools such as Nmap, from receiving a precise measure of significant data of the frameworks that they are scanning. However, these prevention measures can be easily overcome: Nmap has numerous features that were created specifically to bypass these protections. It has the ability to issue a mapping of a system framework, through which you can view a substantial amount of information, from OS renditions to open ports. Firewalls and interruption recognition frameworks are made to keep Nmap and other applications from obtaining that data.

As an ethical hacker or penetration tester, you will come across systems behind firewalls that prevent you from attaining the information that you need. Therefore, you will need to know how to avoid the firewall rules and to glean information about a host. This step in a penetration test is called Firewall Evasion Rules.

Lab Objectives

- Bypass windows firewall using Nmap evasion techniques
- Bypass firewall rules using HTTP/FTP tunneling

Lab Environment

To carry out this lab, you need:

- Windows 10 virtual machine
- Windows Server 2016 virtual machine
- Windows Server 2019 virtual machine
- Parrot Security virtual machine

- Web browsers with an Internet connection
- Administrator privileges to run the tools
- HITHost located at **E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\HTTP Tunneling Tools\HTTHost**
- HTTPPort located at **E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\HTTP Tunneling Tools\HTTPPort**
- You can also download the latest version of the above-mentioned tools from their official websites. If you decide to download the latest version, the screenshots shown in the lab might differ.

 **Tools demonstrated in this lab are available in E:\CEH-Tools\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots**

Lab Duration

Time: 30 Minutes

Overview of Firewalls Evasion Techniques

A firewall operates on a predefined set of rules. Using extensive knowledge and skill, an attacker can bypass the firewall by employing various bypassing techniques. Using these techniques, the attacker tricks the firewall to not filter the malicious traffic that he/she generates.

The following are some firewall bypassing techniques:

- Port Scanning
- Firewalking
- Banner Grabbing
- IP Address Spoofing
- Source Routing
- Tiny Fragments
- Using an IP Address in Place of URL
- Using Anonymous Website Surfing Sites
- Using a Proxy Server
- ICMP Tunneling
- ACK Tunneling
- HTTP Tunneling
- SSH Tunneling
- DNS Tunneling
- Through External Systems
- Through MITM Attack
- Through Content
- Through XSS Attack

Lab Tasks

T A S K 1

Bypass Windows Firewall using Nmap Evasion Techniques

Network/security administrators play a crucial role in creating security defenses within an organization. Though such defenses protect the machines in the network, there might still be an insider who may try to apply different evasion techniques to identify the services running on the target.

In this scenario, consider an admin has written certain Windows Firewall rules to block your system from reaching one of the machines in the network. You will be

taught to use Nmap in such a way that you can perform recon on the target using other active machines on the network and identify the services running on the machine along with their open ports.

1. Before beginning this lab, turn on the **Windows 10**, **Windows Server 2019**, and **Parrot Security** virtual machines.
2. In the **Windows 10** machine, log in with the credentials **Admin** and **Pa\$\$w0rd**.
3. Open the **Control Panel**; navigate to **System and Security → Windows Defender Firewall** and click **Use recommended settings** to turn on Firewall.

T A S K 1 . 1

Turn On Windows Firewall

Figure 2.1.1: Windows Defender Firewall

4. Now, you can see that the Firewall is enabled in the **Windows 10** machine. Click the **Advanced settings** link in the left pane.

Figure 2.1.2: Windows Defender Firewall Turned On

5. The **Windows Defender Firewall with Advanced Security** window appears; here, we are going to create an inbound rule. Select **Inbound Rules** in the left pane and click **New Rule** under **Actions**.

Figure 2.1.3: Creating Inbound Rule

6. The **New Inbound Rule Wizard** appears. In the **Rule Type** section, choose the **Custom** radio button to create a custom inbound rule and click **Next**.

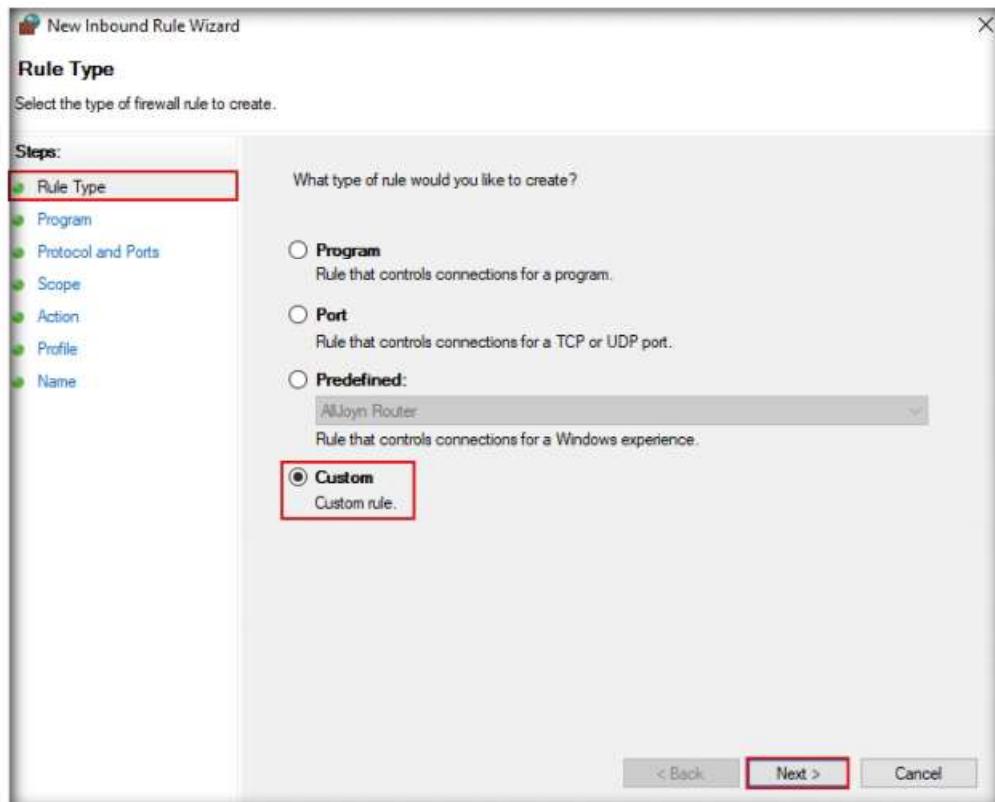

Figure 2.1.4: Rule Type wizard

7. In the **Program** section, leave the settings to default and click **Next**.

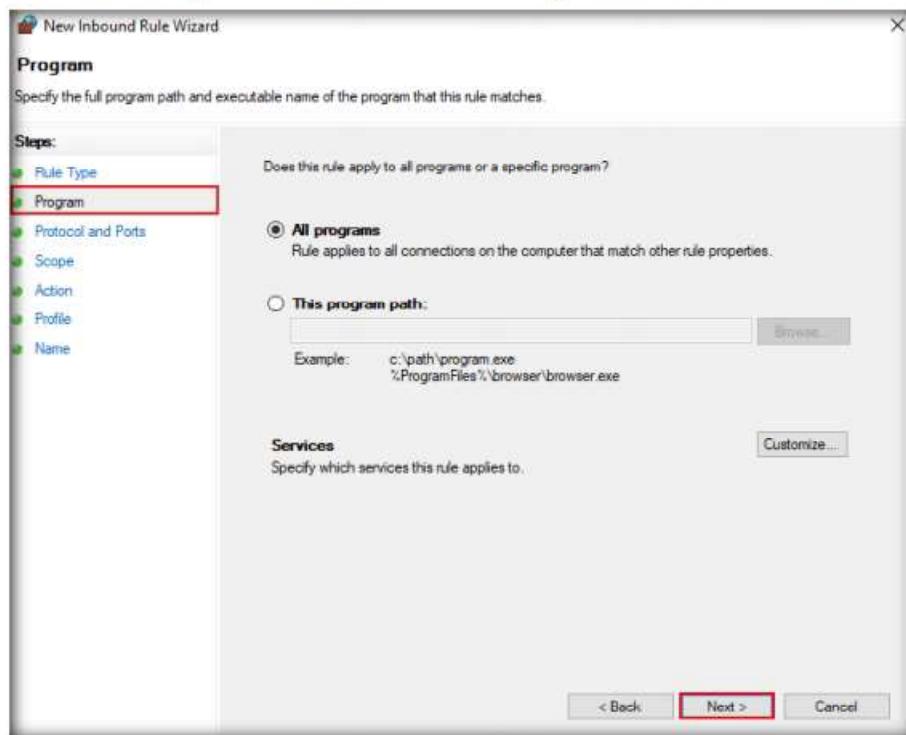

Figure 2.1.5: Program wizard

8. In the **Protocol and Ports** section, leave the settings to default and click **Next**.

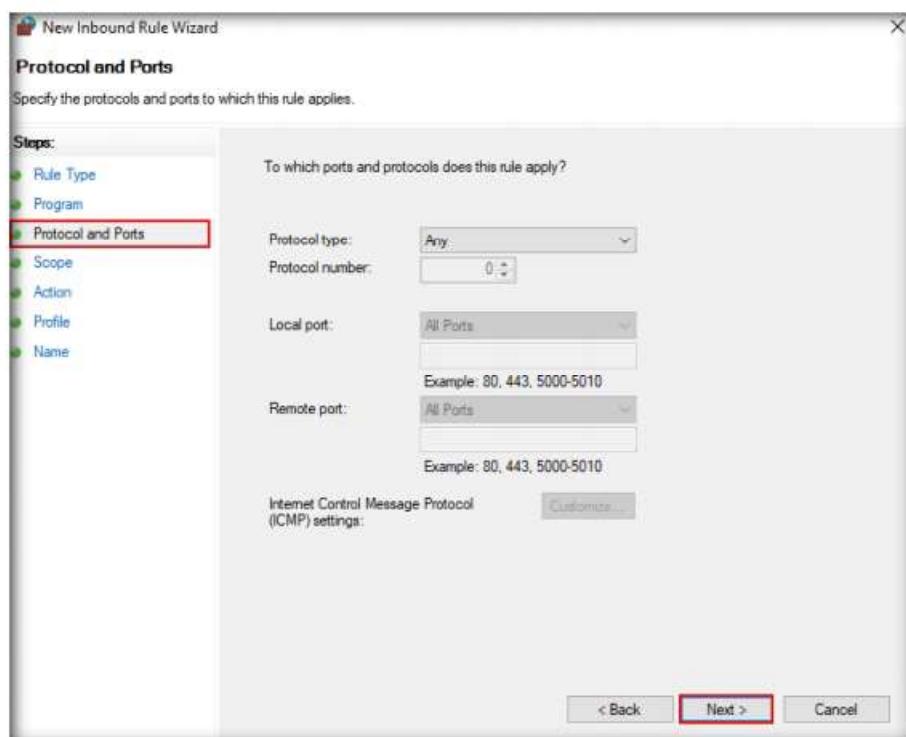

Figure 2.1.6: Protocols and Ports wizard

9. In the **Scope** section, choose the **These IP addresses** radio button under **Which remote IP addresses does this rule apply to?**, and then click **Add...**.

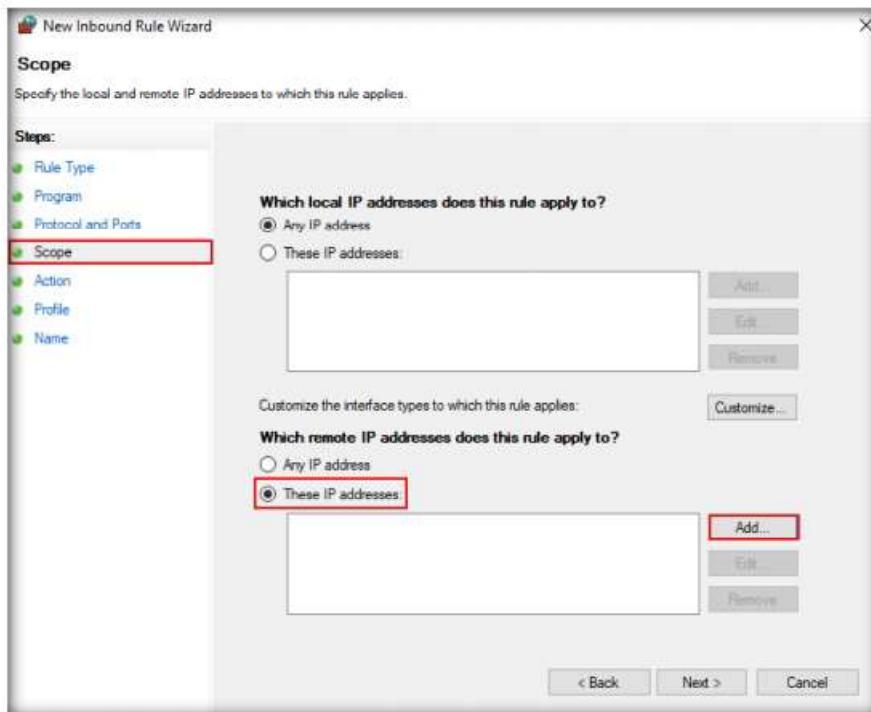

Figure 2.1.7: Scope wizard

10. The **IP Address** pop-up appears; type the IP address of the **Parrot Security** virtual machine and click **OK**.

Note: In this task, the IP address of the Parrot Security is **10.10.10.13**, which may differ in your lab environment.

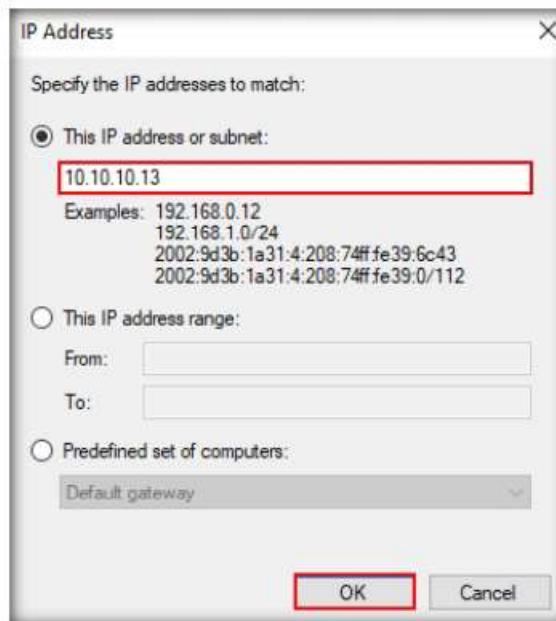

Figure 2.1.8: IP Address window

11. Click **Next** in the **Scope** section once the IP address has been added.

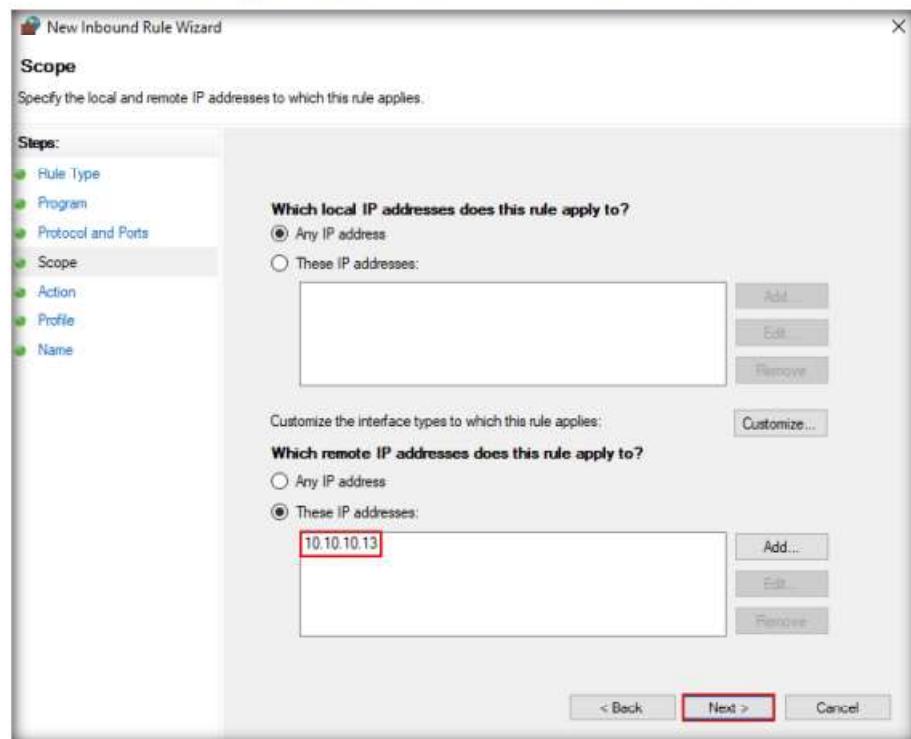

Figure 2.1.9: Scope wizard

12. In the **Action** section, choose the **Block the connection** radio button and click **Next**.
13. By doing this, we are blocking all incoming traffic that comes through the **Parrot Security** virtual machine.

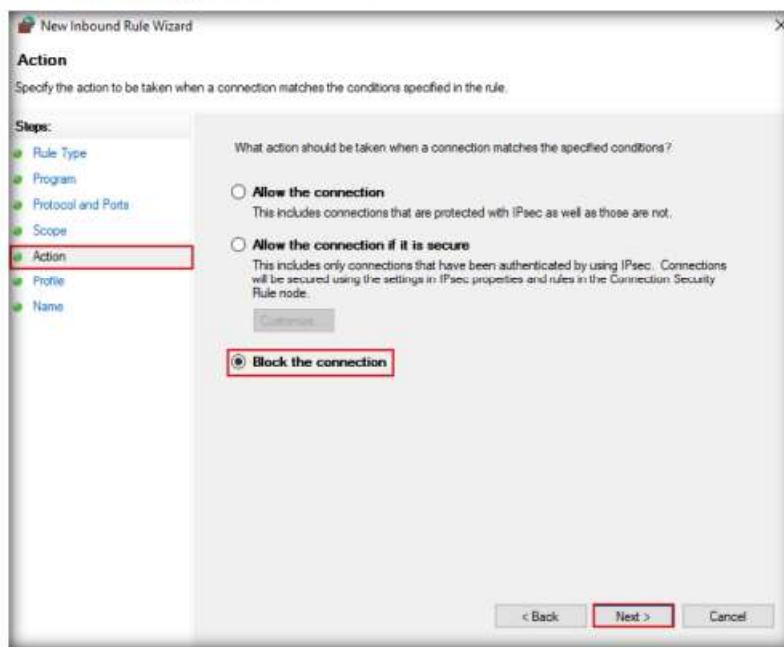

Figure 2.1.10: Action wizard

14. In the **Profile** section, leave the settings on default and click **Next**. By doing this, the newly created rule will apply to all profiles.

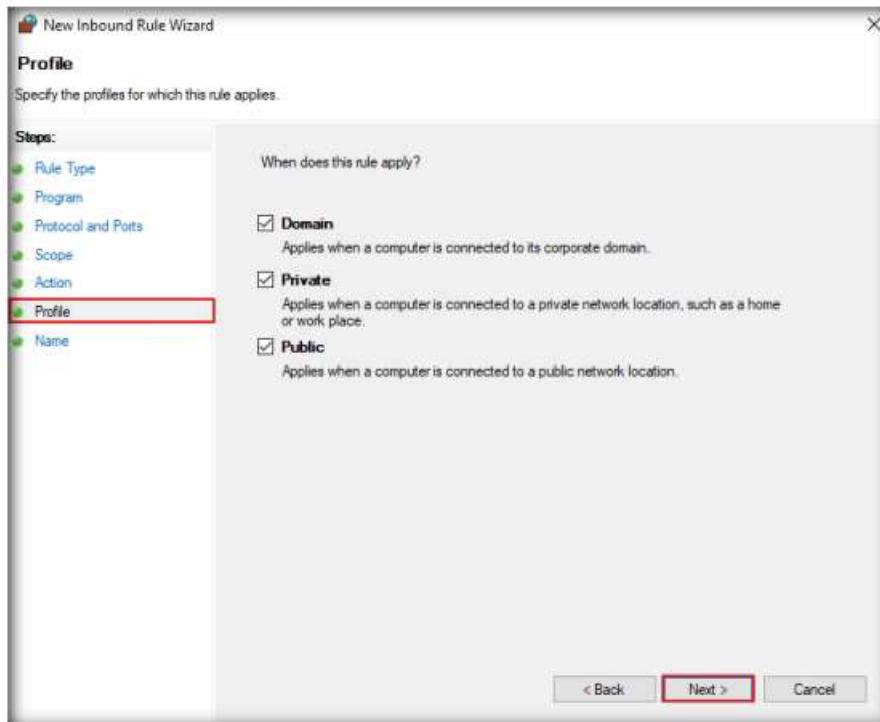

Figure 2.1.11: Profile wizard

15. In the **Name** section, provide any name to the rule and click **Finish**.

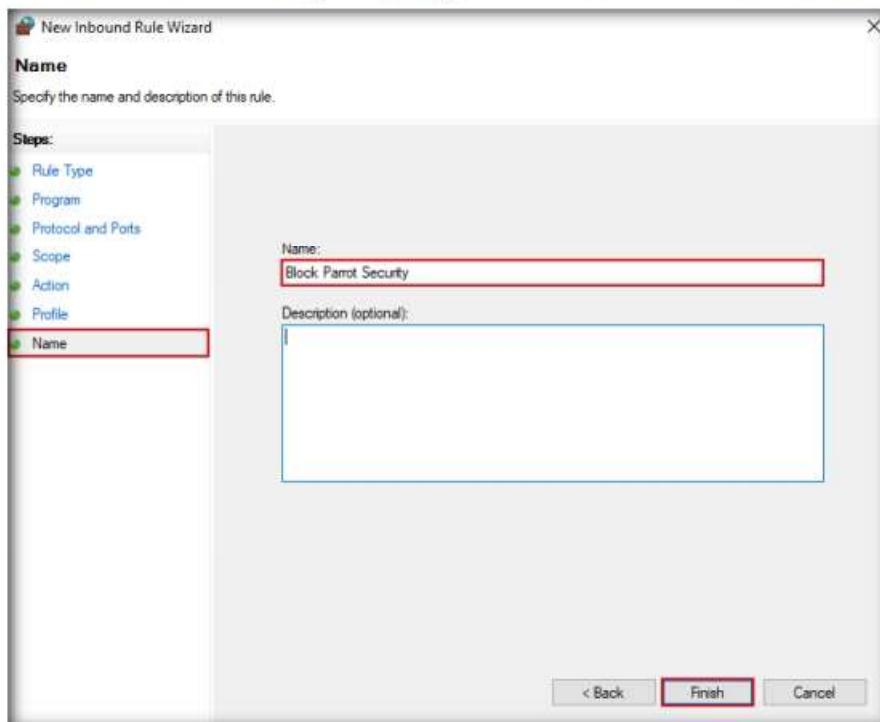

Figure 2.1.12: Name wizard

16. The newly created inbound rule has been configured to the **Windows 10** Firewall. Now, any **Incoming traffic** coming through the **Parrot Security** virtual machine will be **blocked** by the **Windows 10** Firewall.

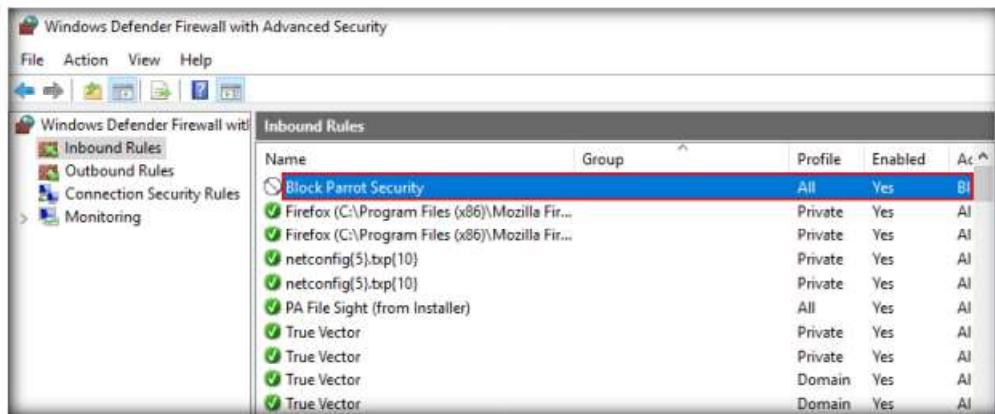

Figure 2.1.13: New rule created

17. Close all open windows in the **Windows 10** machine and switch to the **Parrot Security** virtual machine.
18. In the login page, the **attacker** username will be selected by default. Enter password as **toor** in the **Password** field and press **Enter** to log in to the machine.

Figure 2.1.14: Parrot Security login

Note:

- If a **Parrot Updater** pop-up appears at the top-right corner of **Desktop**, ignore and close it.
- If a **Question** pop-up window appears asking you to update the machine, click **No** to close the window

19. Click the **MATE Terminal** icon at the top of the **Desktop** window to open a **Terminal** window.

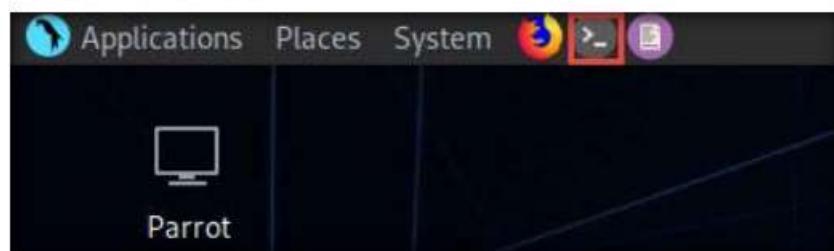

Figure 2.1.15: MATE Terminal launching

20. A **Parrot Terminal** window appears. In the terminal window, type **sudo su** and press **Enter** to run the programs as a root user.

21. In the **[sudo] password for attacker** field, type **toor** as a password and press **Enter**.

Note: The password that you type will not be visible.

22. Now, type **cd** and press **Enter** to jump to the root directory.

23. We will now perform a basic Nmap scan on Windows 10 machine.

24. Type **nmap 10.10.10.10** and press **Enter**. As the Firewall is turned on in the **Windows 10** machine, the output of the Nmap scan shows that all the 1,000 scanned ports on **10.10.10.10** are filtered.

Note: The IP address of the **Windows 10** machine may differ in your lab environment.

```

31. Delete the newly created rule in the **Windows Defender Firewall with Advanced Security** window in the **Windows 10** virtual machine.
32. **Turn off the Windows Defender Firewall** for all **Profiles** in the **Windows 10** virtual machine.
33. Close all open windows in each virtual machine.
34. Turn off the **Parrot Security** virtual machine.

T A S K 2

Bypass Firewall Rules using HTTP/FTP Tunneling

Here, we will learn how networks can be scanned, and how to use HTTPPort and HITHost to bypass firewall restrictions and access files.

Note: Ensure that the **Windows Server 2019** and **Windows 10** virtual machines are running.

T A S K 2.1

Stop World Wide Web Publishing Service

1. Turn on the **Windows Server 2016** virtual machine and log in with the credentials **Administrator** and **Pa\$\$w0rd**.
2. Now, you must ensure that **IIS Admin Service** and **World Wide Web Publishing services** are not running.

HTTP tunneling technology allows attackers to perform various Internet tasks despite the restrictions imposed by firewalls. This method can be implemented if the target company has a public web server with port 80 used for HTTP traffic that is unfiltered by its firewall. This technology encapsulates data inside HTTP traffic (port 80). Many firewalls do not examine the payload of an HTTP packet to confirm that it is legitimate, thus it is possible to tunnel traffic via TCP port 80.

- Click **Start** and click the **Windows Administrative Tools** app. The **Windows Administrative Tools** window appears; double-click **Services** to launch.

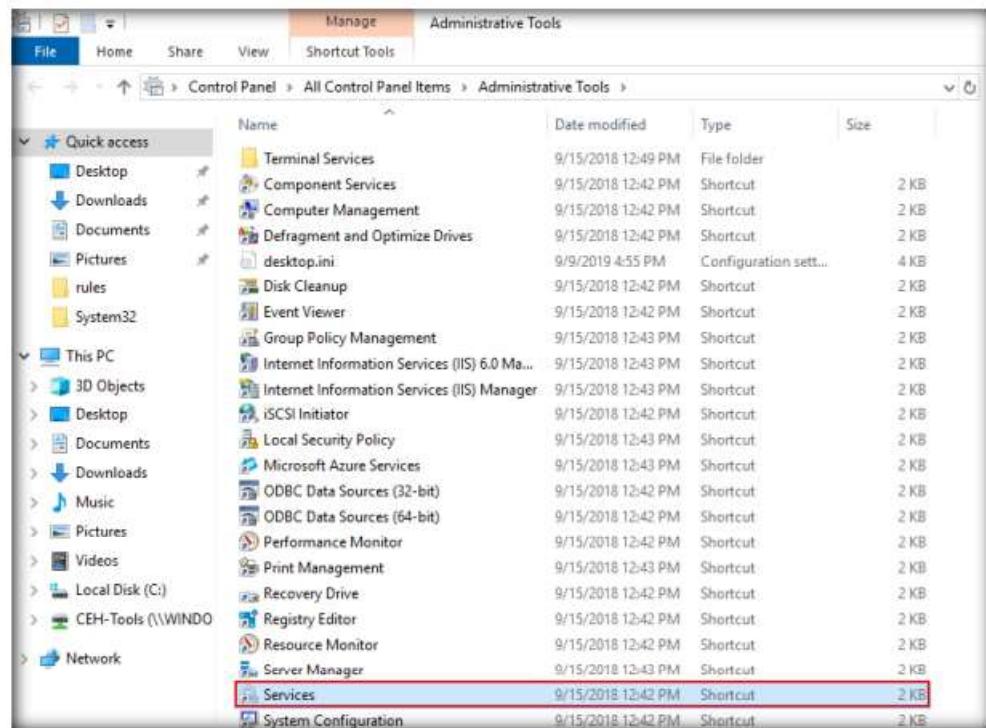

Figure 2.2.1: Launching services

HTTPPort allows users to bypass the HTTP proxy, which blocks Internet access to e-mail, instant messengers, P2P file sharing, ICQ, News, FTP, IRC, etc. Here, the Internet software is configured, so that it connects to a local PC as if it is the required remote server; HTTPPort then intercepts that connection and runs it via a tunnel through the proxy.

- In the **Services** window, scroll down to **World Wide Web Publishing Service** and you can observe that the service is **Disabled** under the **Startup Type** column, as shown in the screenshot.

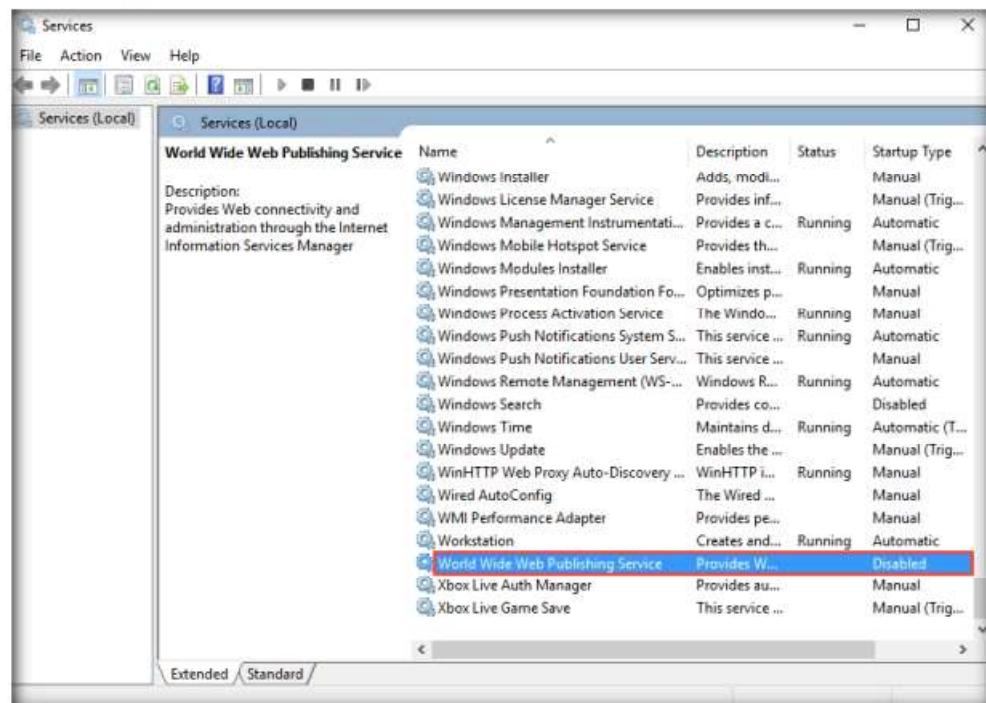

Figure 2.2.2: Stopping World Wide Web Publishing Service in Windows Server 2016

T A S K 2 . 2**Launch and Configure HTTHost**

HTTPort can work on devices such as proxies or firewalls that allow HTTP traffic. Thus, HTTPort provides access to websites and Internet apps. HTTPort performs tunneling using one of two modes: SSL/CONNECT mode and a remote host.

5. Similarly, check **IIS Admin Service**; stop the program if it is running.
6. Navigate to **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\HTTP Tunneling Tools\HTTHost** and double-click **htthost.exe**.
7. If the **Open File - Security Warning** pop-up appears, click **Run**.
8. A **HTTHost** wizard appears; click the **Options** tab.
9. On the **Options** tab, leave **90** as the port number in the **Port** field under the **Network** section. Keep the other settings on default, except for **Personal password**, which should contain any other password. In this task, the **Personal password** is “**magic**.”

Note: Typically, HTTP tunneling should be performed using port 80. Port 80 is being used to host the local websites, therefore we have used port 90 for this lab.

10. Ensure that **Revalidate DNS names** and **Log connections** are checked and click **Apply**.

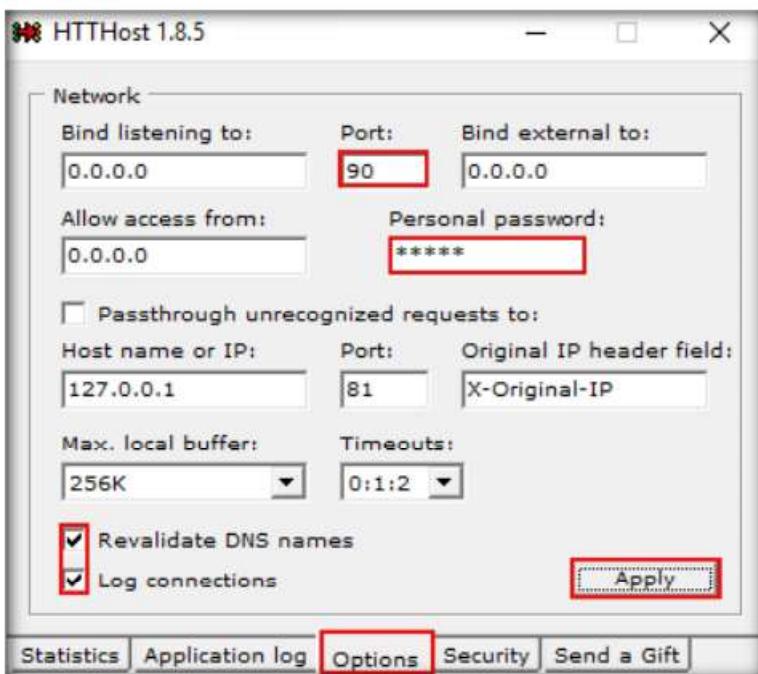

Figure 2.2.3: HTTHost Options tab

11. Navigate to the **Application log** tab and check if the last line is **Listener: listening at 0.0.0.0:90**, which ensures that HTTHost is running properly and has begun to listen on **port 90**.

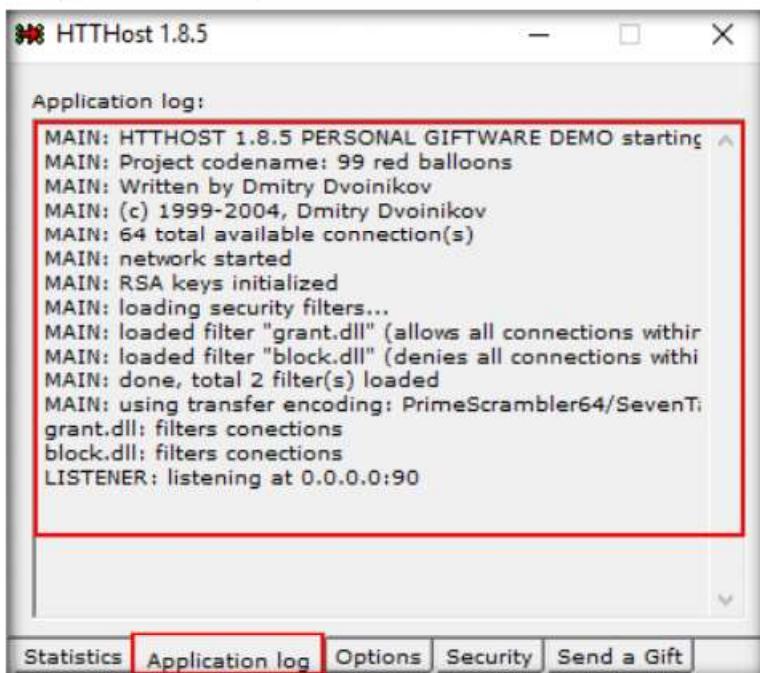

Figure 2.2.4: HTTHost Application log section

12. Now, leave **HTTHost** running, and do not turn off the **Windows Server 2016** virtual machine.
13. Now, switch to the **Windows Server 2019** virtual machine and launch **Control Panel**, as shown in the screenshot.

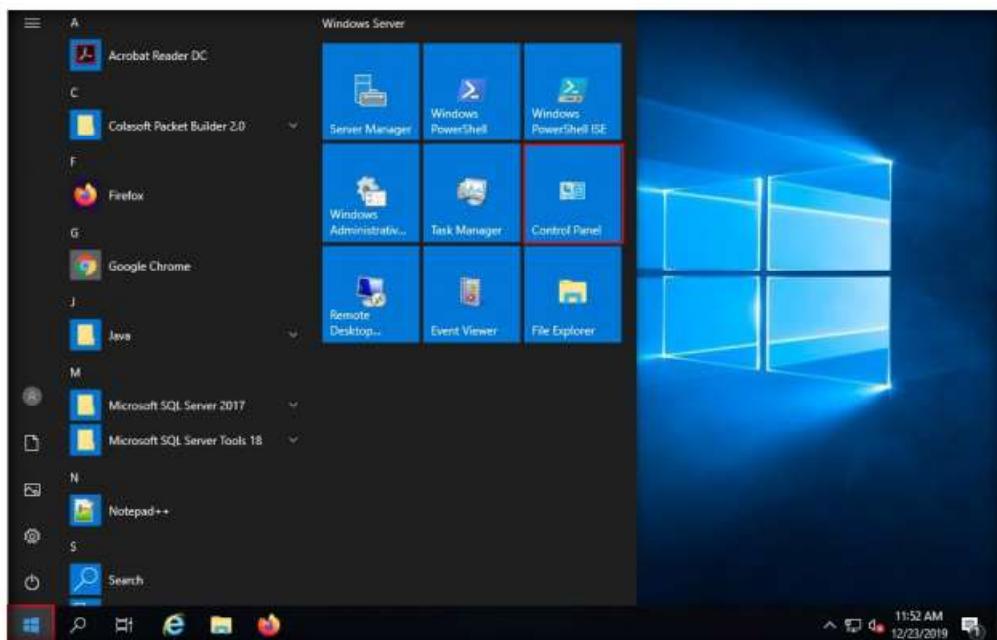

Figure 2.2.5: Launching Control Panel

The proxy responds as if the user is surfing a website and thus allows the user to do so. HTTHost, in turn, performs its half of the tunneling and communicates with the target servers. This mode is much slower, but works in the majority of cases and features strong data encryption that makes proxy logging useless.

14. The **Control Panel** window appears with all control panel items displayed. Select **Windows Defender Firewall**.

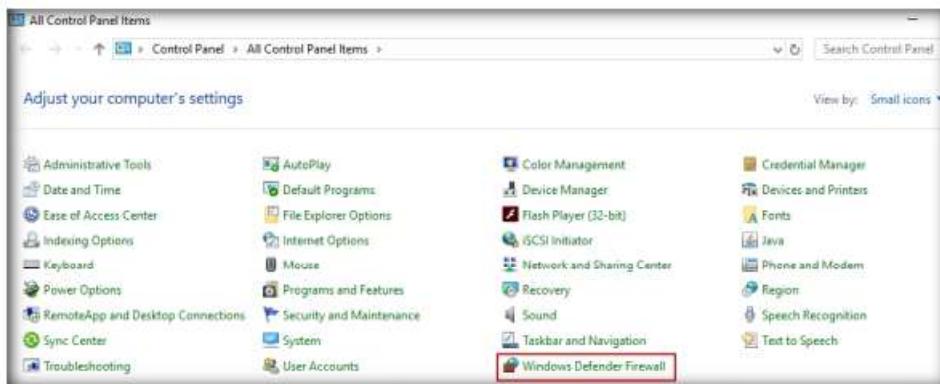

Figure 2.2.6: Opening Windows Firewall

15. The **Windows Defender Firewall** control panel appears; click the **Turn Windows Defender Firewall on or off** link in the left pane.

Figure 2.2.7: Configuring Windows Firewall

16. The **Customize Settings** window appears.

17. Select **Turn on Windows Defender Firewall** under **Private network settings** and **Public network settings**.

18. Click **OK**.

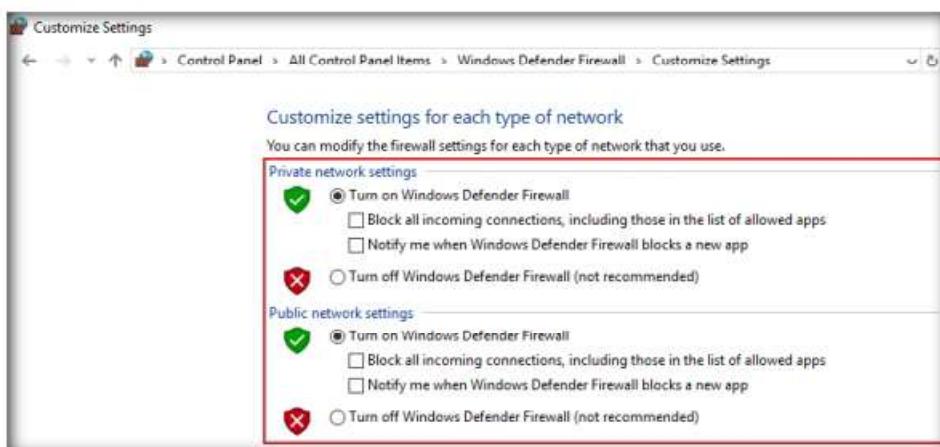

Figure 2.2.8: Configuring Windows Firewall

19. The firewall is successfully turned on. Now, click **Advanced settings** in the left pane.

Figure 2.2.9: Configuring Advanced Windows Firewall

20. The **Windows Firewall with Advanced Security** window appears.
 21. Select **Outbound Rules** in the left pane. A list of outbound rules is displayed. Click **New Rule...** in the right pane under **Outbound Rules**.

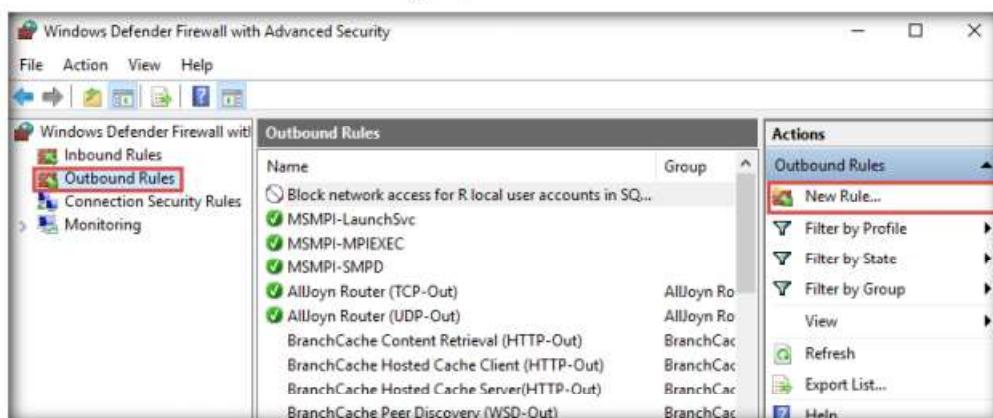

Figure 2.2.10: Adding a new outbound rule

22. In **New Outbound Rule Wizard**, select **Port** as **Rule Type** and click **Next**.

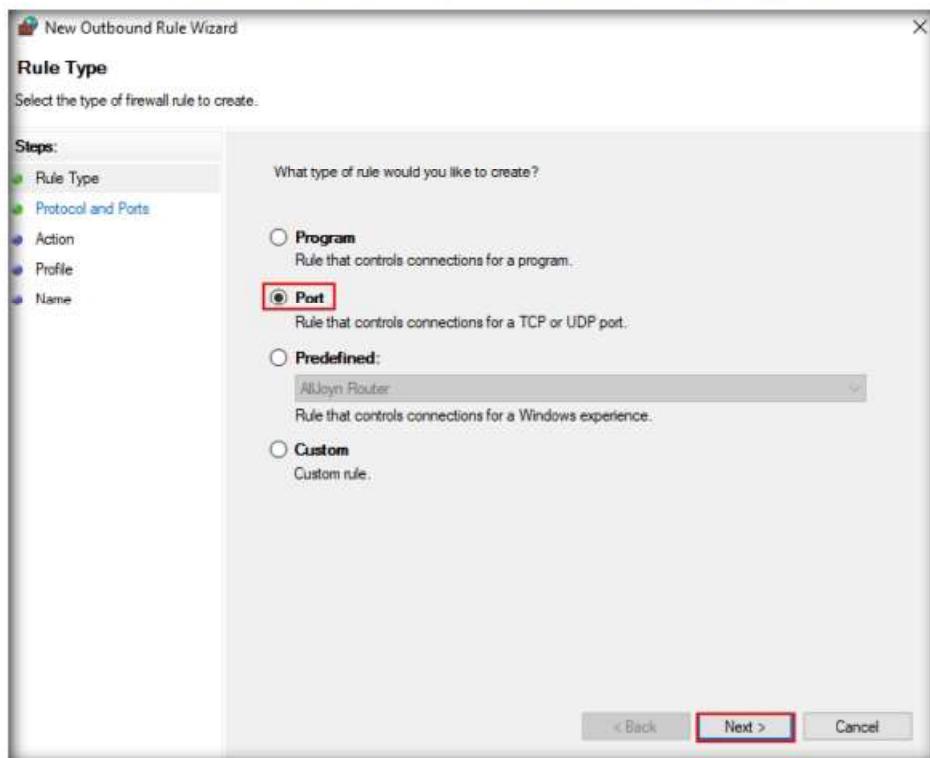

Figure 2.2.11: Windows Firewall Selecting a Rule Type

23. Select **All remote ports** in **Protocol and Ports** and click **Next**.

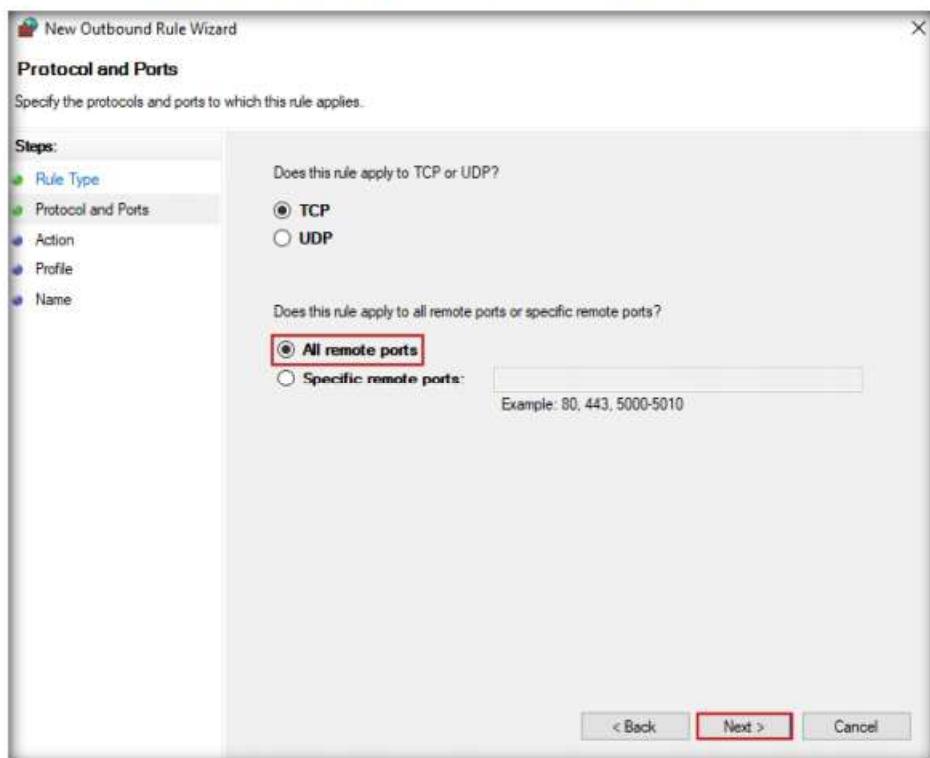

Figure 2.2.12: Windows Firewall assigning Protocols and Ports

24. In **Action**, **Block the connection** is selected by default and click **Next**.

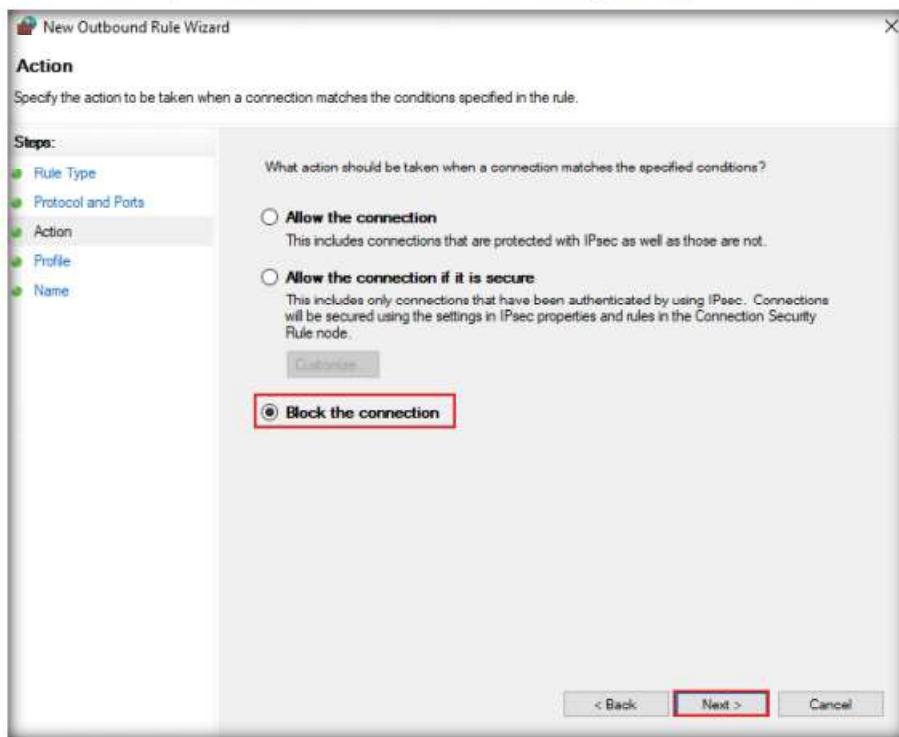

Figure 2.2.13: Windows Firewall setting an Action

25. In the **Profile** section, ensure that all options (**Domain**, **Private**, and **Public**) are checked and click **Next**.

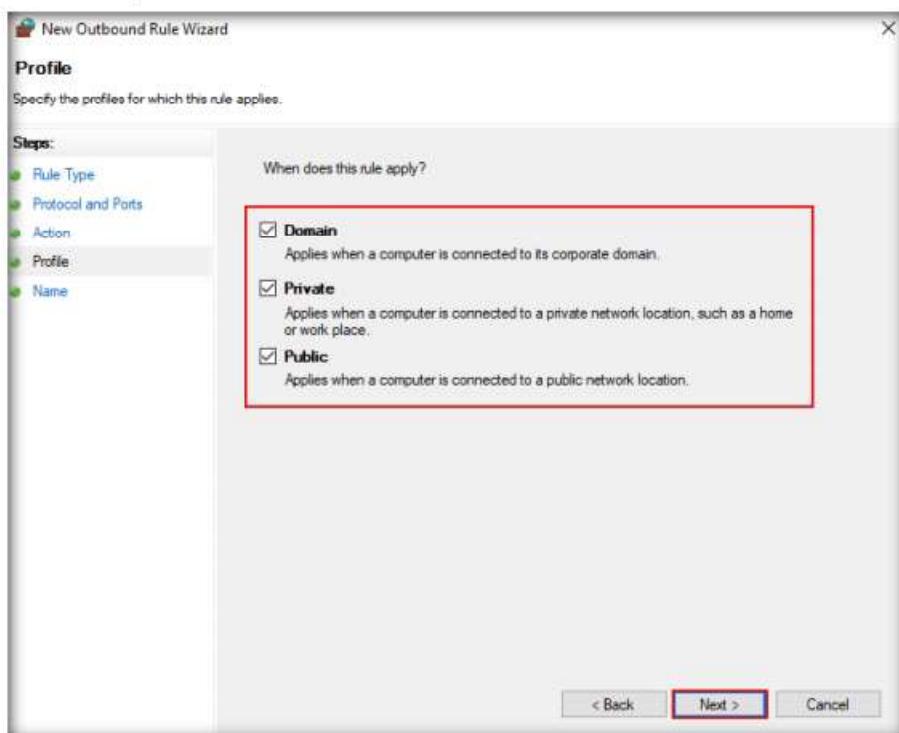

Figure 2.2.14: Windows Firewall Profile settings

26. In **Name**, type **Port 21 Blocked** in the **Name** field and click **Finish**.

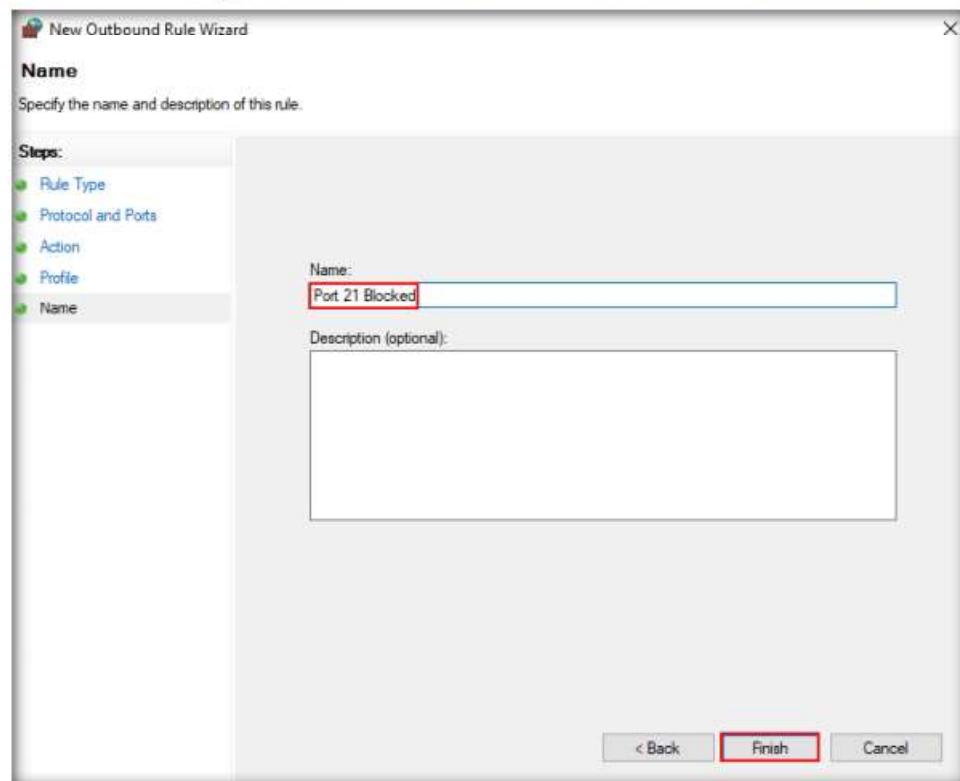

Figure 2.2.15: Windows Firewall assigning a name to Port

27. The new rule **Port 21 Blocked** is created, as shown in the screenshot.

The screenshot shows the 'Windows Defender Firewall with Advanced Security' interface. The title bar says 'Windows Defender Firewall with Advanced Security'. The left navigation pane shows 'Outbound Rules' selected. The main area is titled 'Outbound Rules' and displays a table of rules. One rule, 'Port 21 Blocked', is highlighted with a red box. The table columns are: Name, Group, Profile, Enabled, and Action. The 'Action' column for 'Port 21 Blocked' is 'Block'. The 'Actions' pane on the right lists options like 'New Rule...', 'Filter by Profile', 'View', 'Refresh', 'Export List...', and 'Help'.

Name	Group	Profile	Enabled	Action
Port 21 Blocked	All	Yes	Block	
Block network access for ...	All	Yes	Block

```

Figure 2.2.20: Issuing FTP command

Note: In the above-mentioned command, **10.10.10.10** refers to the IP address of **Windows 10** where the ftp site is located. Make sure that you issue the IP address of Windows 10 in your lab environment.

35. This means you can establish an FTP connection, and then close the command prompt window.
 36. Now, enable the rule and check whether you can establish a connection.
 37. Right-click the newly added rule and click **Enable Rule**.

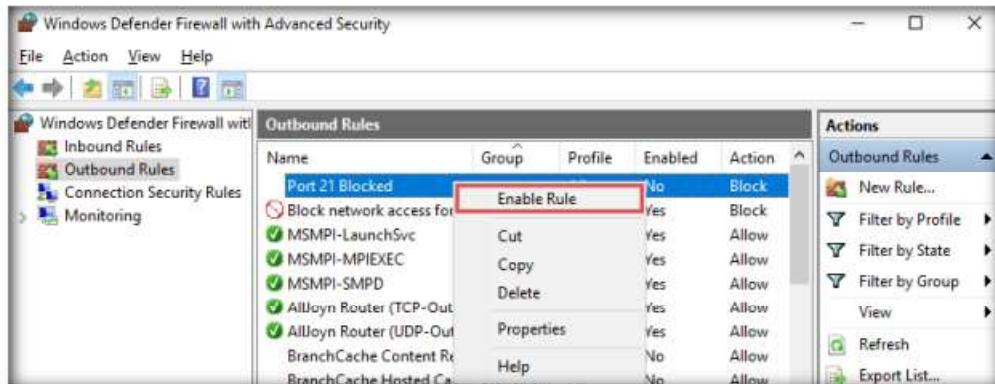

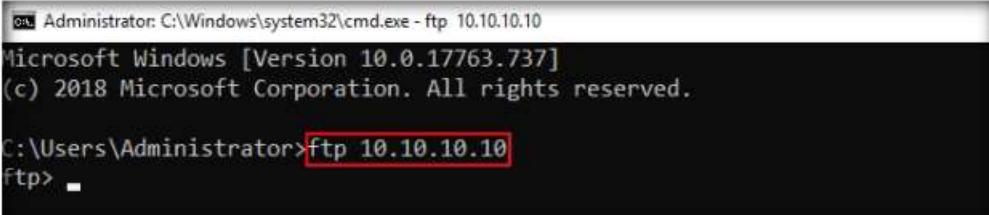

Figure 2.2.21: Enabling the outbound rule

38. Launch **Command Prompt** and check whether you can connect to the ftp site by issuing the command **ftp 10.10.10.10**.
39. The added outbound rule should block the connection, as shown in the screenshot.

```
Administrator: C:\Windows\system32\cmd.exe - ftp 10.10.10.10
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\Administrator>ftp 10.10.10.10
Ftp> -
```

Figure 2.2.22: Issuing FTP command

Note: In the above-mentioned command, **10.10.10.10** refers to the IP address of **Windows 10**, where the ftp site is located. Make sure that you issue the IP address of Windows 10 in your lab environment.

40. Now, we will perform **tunneling** using **HTTPort** to establish a connection with the FTP site located on **Windows 10**.
41. Navigate to **Z:\CEHv11 Module 12 Evading IDS, Firewalls, and Honeypots\HTTP Tunneling Tools\HTTPort** and double-click **httpport3snfm.exe**.
42. If a **User Account Control** pop-up appears, click **Yes**.
43. Follow the installation steps to install HTTPort.

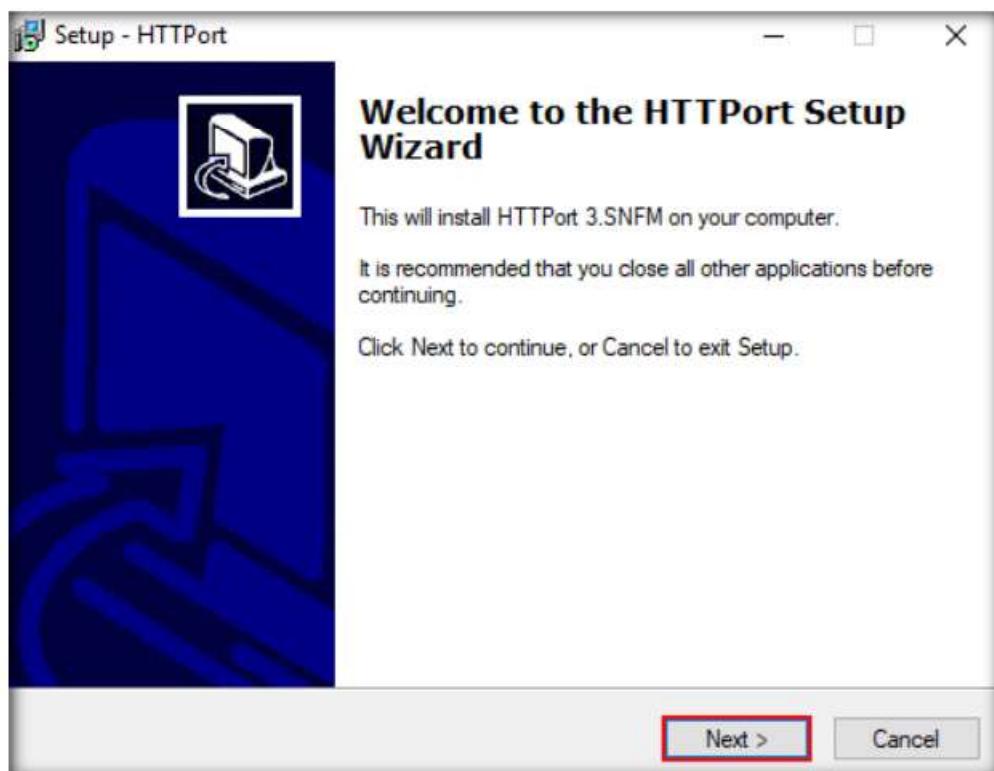

Figure 2.2.23: HTTPort Setup wizard

 **T A S K 2 . 5**

**Perform HTTP
Tunneling**

44. Launch **HTTPort** (**HTTPort 3SNFM**) from the **Start** menu.

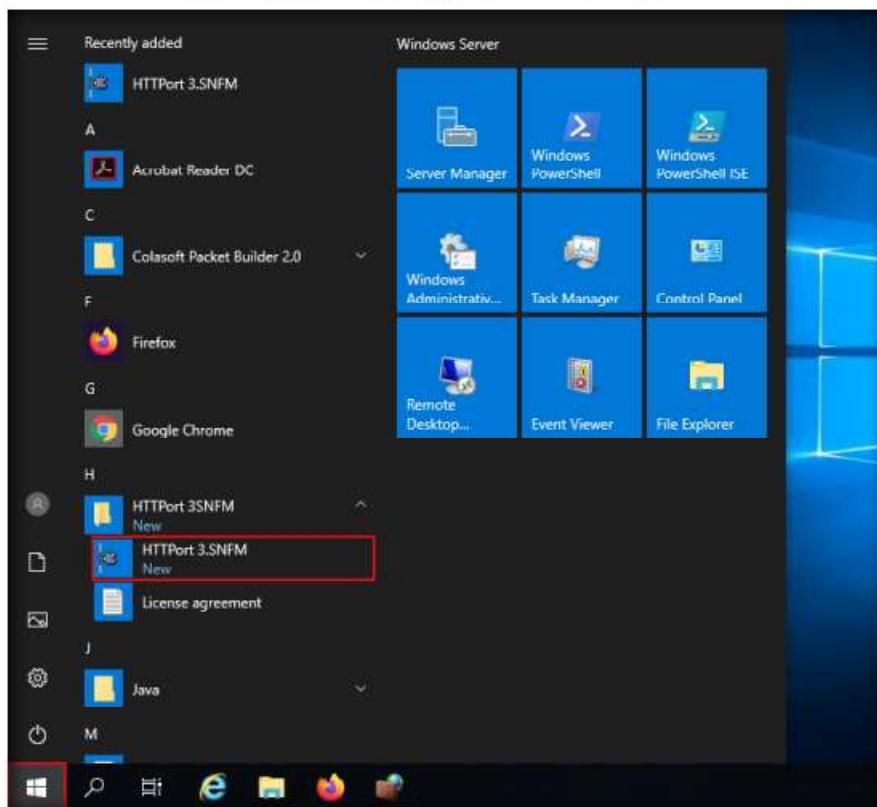

Figure 2.2.24: Windows Server 2012 Apps screen

45. An **Introduction to HTTPort** wizard appears; click **Next** five times, until you come to the last wizard pane, and then click **Close**.

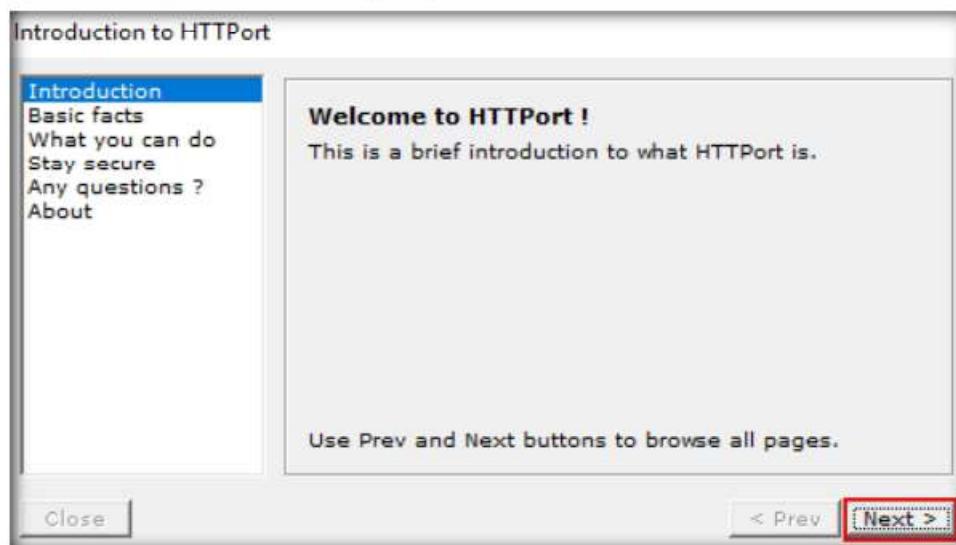

Figure 2.2.25: Introduction to HTTPort wizard

46. The **HTTPort** main window (**HTTPort 3.SNFM**) appears, as shown in the screenshot.

47. On the **Proxy** tab, enter the **Host name or IP address (10.10.10.16)** of the machine where HTTHost is running (**Windows Server 2016**).

Note: The IP address of **Windows Server 2016** may vary in your lab environment.

48. Enter the **Port** number **90**.

49. In the **Misc. options** section, select **Remote host** from the **Bypass mode** drop-down list.

50. In the **Use personal remote host at (blank = use public)** section, re-enter the IP address of **Windows Server 2016 (10.10.10.16)** and port number **90**.

51. Enter the password **magic** into the **Password** field.

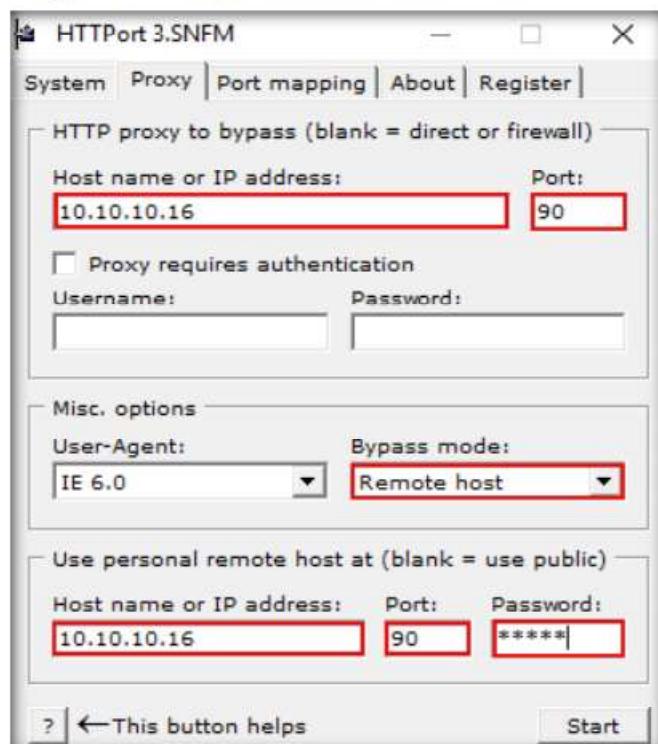

Figure 2.2.26: HTTPort Proxy settings window

52. Select the **Port mapping** tab, and click **Add** to create a new mapping.

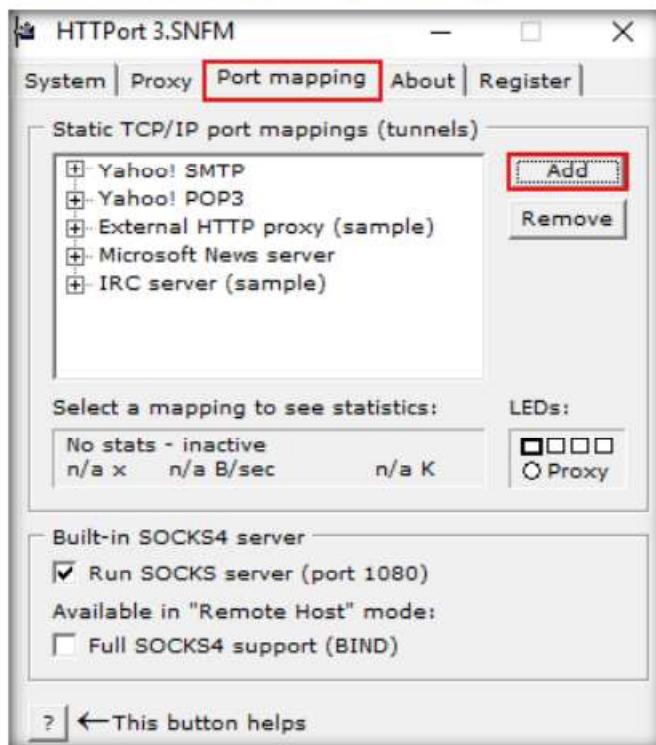

Figure 2.2.27: HTTPort creating a new mapping

53. Right-click the **New mapping** node, and click **Edit**.

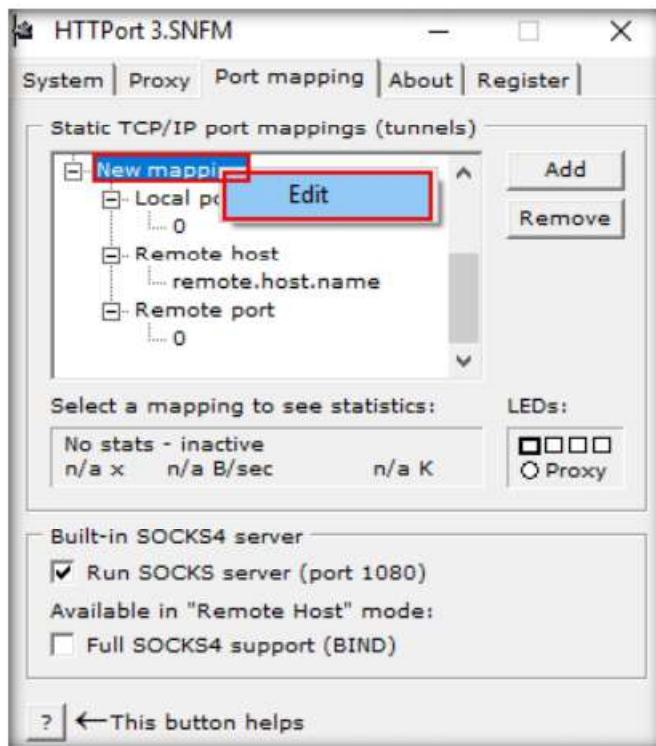

Figure 2.2.28: HTTPort Editing to assign a mapping

54. Rename this as **ftp test** (you can enter the name of your choice).
55. Right-click the node below **Local port**; then click **Edit** and enter the port value as **21**.
56. Right-click the node below **Remote host**; click **Edit** and rename it as **10.10.10.10**.
57. Right-click the node below **Remote port**; then click **Edit** and enter the port value as **21**.

Note: **10.10.10.10** specifies in Remote host node is the IP address of the **Windows 10** machine that is hosting the FTP site.

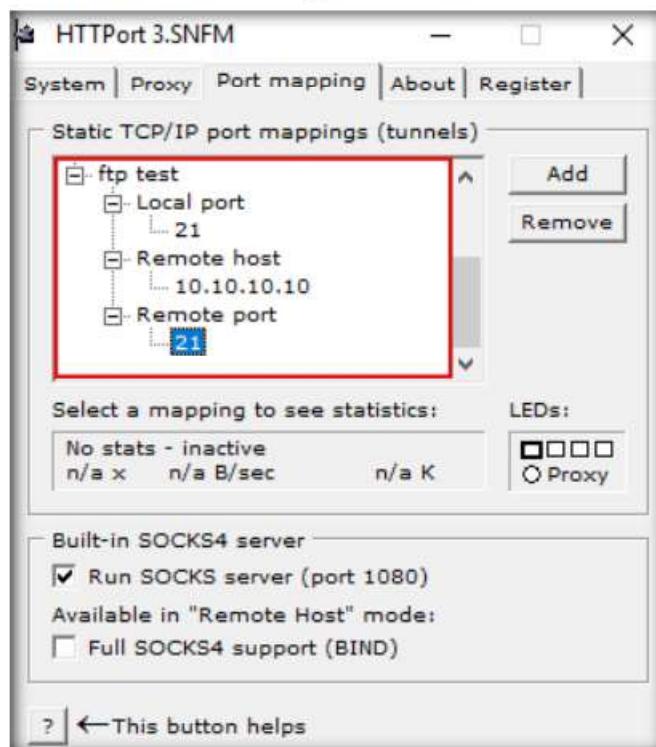

Figure 2.2.29: HTTPort Static TCP/IP port mapping

58. Switch to the **Proxy** tab and click **Start** to begin the HTTP tunneling.

Note: If you get an error, ignore it.

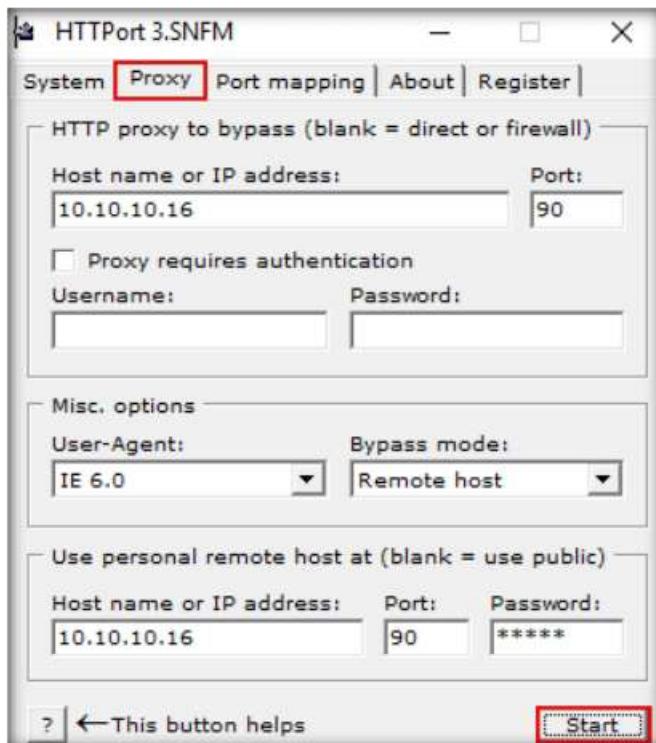

Figure 2.2.30: HTTPort to start tunneling

59. HTTPort intercepts the ftp request to the localhost and tunnels through it. HTTHost is installed in the remote machine to connect you to **10.10.10.10**.

Note: This means you may not access the ftp site directly by issuing **ftp 10.10.10.10** in the command prompt, but you will be able to access it through the localhost by issuing the command **ftp 127.0.0.1**.

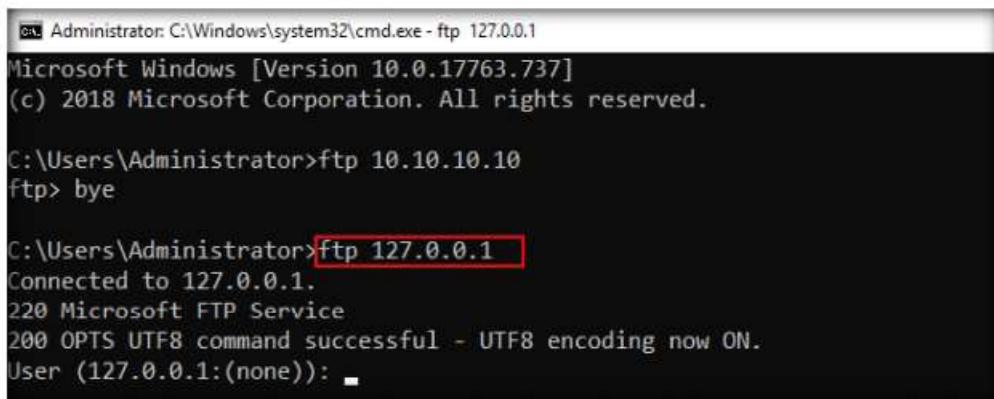

60. In **Windows Server 2019**; launch **Command Prompt**, type **ftp 10.10.10.10**, and press **Enter**. The ftp connection will be blocked by the outbound firewall rule.

```
Administrator: C:\Windows\system32\cmd.exe - ftp 10.10.10.10
C:\Users\Administrator>ftp 10.10.10.10
ftp>
```

Figure 2.2.31: ftp connection is blocked

61. Now, launch a new **Command Prompt**, type **ftp 127.0.0.1**, and press **Enter**. You should be able to connect to the site.

Note: If you issue this command without starting HTTPort, the connection to the FTP site fails, stating that the FTP connection is refused.

```
Administrator: C:\Windows\system32\cmd.exe - ftp 127.0.0.1
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

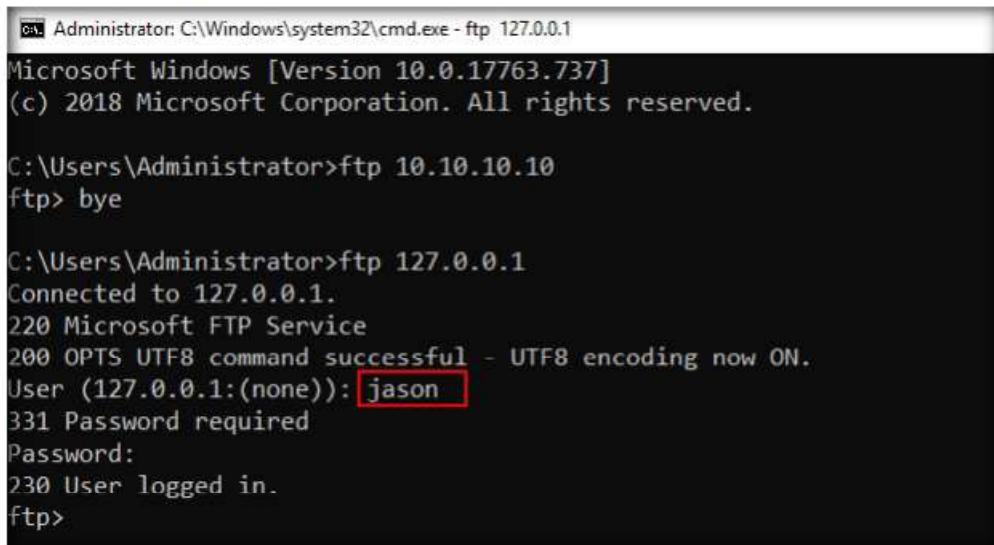

C:\Users\Administrator>ftp 10.10.10.10
ftp> bye

C:\Users\Administrator>ftp 127.0.0.1
Connected to 127.0.0.1.
220 Microsoft FTP Service
200 OPTS UTF8 command successful - UTF8 encoding now ON.
User (127.0.0.1:(none)): ■
```

Figure 2.2.32: Executing ftp command

62. Enter the credentials of any user account on Windows 10. In this lab, we are using the credentials of the **Jason** account (username: **Jason**; Password: **qwerty**). Type the username and press **Enter**.

Note: The password you enter will not be visible.

```
Administrator: C:\Windows\system32\cmd.exe - ftp 127.0.0.1
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\Administrator>ftp 10.10.10.10
ftp> bye

C:\Users\Administrator>ftp 127.0.0.1
Connected to 127.0.0.1.
220 Microsoft FTP Service
200 OPTS UTF8 command successful - UTF8 encoding now ON.
User (127.0.0.1:(none)): jason
331 Password required
Password:
230 User logged in.
ftp>
```

Figure 2.2.33: Signing in to the FTP site

63. You are successfully logged in, even after adding a firewall outbound rule inferring that a tunnel has been established by HTTPort and HTTHost and therefore have bypassed the firewall.

64. Now you have the access and ability to add files in the ftp directory located in the **Windows 10** virtual machine.

65. Type **mkdir Test** and press **Enter**.

```
Administrator: C:\Windows\system32\cmd.exe - ftp 127.0.0.1
Microsoft Windows [Version 10.0.17763.737]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\Administrator>ftp 10.10.10.10
ftp> bye

C:\Users\Administrator>ftp 127.0.0.1
Connected to 127.0.0.1.
220 Microsoft FTP Service
200 OPTS UTF8 command successful - UTF8 encoding now ON.
User (127.0.0.1:(none)): jason
331 Password required
Password:
230 User logged in.
ftp> mkdir Test
257 "Test" directory created.
ftp> -
```

Figure 2.2.34: Creating a directory

66. Now, switch to the **Windows 10** machine.

67. A directory named **Test** will be created in the **FTP** folder on the **Windows 10** (location: **C:\FTP**) virtual machine, as shown in the screenshot:

Figure 2.2.35: New directory created

68. Thus, you are able to bypass HTTP proxies as well as firewalls, and thereby access files beyond them.

Note: On completion of the lab, delete the created outbound rule, stop **HTTPHost** and **HTTPPort** and disable the firewall (which was enabled in the beginning of the lab) in the machine (i.e., **Windows Server 2019**), and start the World Wide Web Publishing and IIS Admin Services on the **Windows Server 2016** virtual machine.

Lab Analysis

Analyze and document all the results discovered in the lab exercise.
